Atari Microsoft BASIC II
VisiCalc
Atari Speed Reading (cass)
States & Capitals (cass)
**I've also got old Atari Computer game carts including Defender, Pacman,
Missile Command, etc., but haven't gone through that box yet...

Books/Magazines:

Assorted issues from Antic and Analog (don't ask me which ones, I have NO
idea anymore)
and diskettes
Compute's First/Second/Third Book(s) of Atari (took me forever to complete
the set)
Mapping the Atari
De Re Atari
Compute's Book of Atari Graphics
Your Atari Guide to 400/800 Personal Computing
Users Guide to Atari
Atari Games and Recreations
Games for Your Atari Computer
Atari Assembler

Still reading this?!? COOL!! In that case, here's some more...

ST Hardware:

1 520 ST (512K w/mouse & power supply)
1 SMM804 Dot matrix printer (that worked until I changed the DIP switches
and forgot where
they were to begin with... Duh...)
1 SF413 DS external disk drive
1 PS3000 Color monitor (w/SS internal disk drive)
PLUS - Cables and power supplies to make it all go.
MIDI cables

ST software (all with boxes and manuals):

Microsoft Write
Leather Goddesses of Phobos
Monty Python's Flying Circus
Motorhead
Skweek
MIDI Maze
Great Chefs #s 1, 2, &3
Vindicators
and a few others...

100 or so assorted floppies

* * Now that you've read this far, here is what I want for all of this * *

$400 obo.

I can be haggled with and we can work out something for shipping because
this is a buttload of goodies, after all.

Leave me email at GregLegg@Aol.Com.

Thanks for your time!

>would be nice to have a better development environment with a program like
>Mac/65. Specifically, cut and paste as well as scrolling up and down through
>the file would be at the top of my list

I desparately tried to convince Mac/65's author to support a better editor. He was completely uninterested, and kept saying things like, "Mac/65 is so fast, it really doesn't matter." Mac/65's editor doesn't even support full screen editing when entering source code (in autonumber mode). There's *NO* excuse for that.

He was totally clueless to the fact that actual program assembly time is a very small piece of the overall development time of a project. Even if assembly time were reduced to zero, I would only be able to complete projects maybe 1% faster. By comparison, editor features like being able to follow the path of subroutine calls and back, going directly to lines that had assembly errors, cut & paste, etc. payoff big time in the course of development.

The editor and debugger sections of a development system are more important than the assembler itself, for the simple reason that most of the development process is spent in those sections.

The current Sweet-16 design does not do this. But it can be done, and it
is very likely that such a design will be produced and sold some day in
the future.

> So, the major reason for changing graphics chips would be to

Because it is way too slow. It also doesn't do color, for things like
ANSI color terminal emulation, picture viewing, or any other graphic
enhancements.

Bill; I believe I tried it twice with the binary mode set, once with ascii since I was under the impression if you ask for ascii the files are automatically sent UUE & decoded at Portal. Once again, it wasn't the entire file that was busted, Discomm managed to pick off quite a bit of those files intact before it bailed out. I'll give it one more shot this weekend to see if the problems been fixed, but like I said, I transfered 4 or 5 files out of Xmission the same week without any problems. Since I got 4 or 5 bad titles out of umich & the same number of good ones from sites like Xmission & oakland I'm pretty sure the problem wasn't with me or Portal. The copy of DSKTOATR I used was from the same session at umich & it worked fine on the xmission files, just not on some of the same files from umich.

A new OS would be good if a goodly part of it were in ROM, banked ROM if necessary. Diamond GOS cart was done this way, as was Sparta-X for that reason (although these are more like OS layers than an OS). And what of the old ROM? A Rom-switcher would have to be hacked of course... This is old hat in the Amiga universe. And they keep the old 1.3 OS for the same reason most 8-bit users would use the old OS...

GAMES!

On a 65816 system, on the other hand, you have RAM to spare so you might as well make THAT softwarebased.

: 256K 8-bit to run the kind of GUI Bill is asking for, much less any apps

The original Amiga 1000 was sold with, I believe, 256K and it had to share that the coprocessors (screen and sound memory). Most of the OS was run from ROM. That's how you get around it. Yes, I think it's a tall order on a 6502. But not for a 65816 with linear memory. Mind you, the Atari8 has a far simpler archetecture and therefore the graphics and sound portion of the OS would be much simpler and therefore smaller than on more modern systems.

The problem with prior GUI efforts on the A8 is that they act simply as AtariDOS replacements and don't really do anything useful with the icons. MACs have their resouce and data portions and the ICON info is stored in the single file. Amigas use a separate Info file that can contain "tooltypes", stack size, and comments that affect how programs are run when clicked on. Building a GUI is more than just having a graphical AtariDOS replacement. It has to have some kind of icon methodology, special icons like appicons for drag and drop, and some kind of task manager and screen switcher.

: Shoot, while we're at it, how about arranging for the next version of the

PCXformer is still not perfect, and as long as that is the case, it is not a viable replacement.

Just because it's tough doesn't mean it shouldn't be encouraged. I HATE it when people say "don't bother, it's too much work". This is a cynical attitude. If he wants to try it, let him try it. If he fails, don't jump on his back.

The amount of attention this subject is getting is better than the low traffic this newsgroup has been suffering from so why bitch and whine?

I can think of many examples to the contrary, including the Apple II, our beloved Atari 8-bit computers, and dozens of dedicated game machines. I think that the things you mentioned are nice, but they aren't necessary. I'm not against a new operating system; it would be an interesting project. I just don't think the lack of such is the reason that good Atari software isn't appearing. The all-time best word processor (and integrated package) in my opinion is AppleWorks. It's still worth using in 1995. And it runs on a cheesy old Apple IIe.

Hey. I believe you can simply get a copy of PC Xformer (like 2.52)
and steal the .ROM images out of it and rename them. You've got an unZIPper
for your Mac, right? It's been a while (I've been a (not very active)
beta-tester for Rainbow) but I'm pretty sure that's all I did to get it
to work.

Regarding your BBS- no, but it sounds cool. I wrote my own BBS (over and
over again until finally one YEAR I had an actual THING people could
call up and leave messages on and stuff.. not very good though, very
UN-fool-proof). I didn't have a modem for my 8bit until a few years ago
(don't have any anymore.. it was an SX212 who's SIO port got killed),
nor have I ever lived anywhere near NJ. :)

As for Alt.Reality multitasking - umm, the best I can think of is that
the music and sound fx were handled by VBI routines- that's about as
close to "multitasking" as you can easily (and usefully) get on an XL...
And most games do it... (use VBI for sound or at least music - mainly
because the music's tempo shouldn't speed up when there's little action
and then slow way down when stuff starts happening in the game :))

AFAIK, no, it was not. It was the first Infocom title that
required 128K and 80-columns. The game data itself took up
260K (Zorks I-III were around 80K each for comparison).

I'm not sure if any 8-bits got the game. (Apple IIe/c maybe?)

>Is it available anywhere?

>Does anyone out there have it?

For the PC I do. If anyone were to compile one of the freeware
ZIL (Infocom game file) interpreters on the 8-bits,
you could play it. What with expanded RAM, the Flickerterm
technique, and more disk space... the time is right.

There are a few available on ftp.gmd.de, I assume C
source.

I personally pictured no such thing. My idea was this: two Gr9 layers
and a Gr10 layer. No one needs to remind me the implications of
changing secen registers per scan line.

I hope this will be built outside the Atari case, and be switchable.
To be perfectly honest, a way to convert the luma signal so that bright
red appears to be red instead of pink would be best (reducing the white
levels in everything, I forget what it's called)

> Also take a look at Clay Halliwell's program that views CV pics and

Steven Harris <sharris@bobcat.ent.ohiou.edu> writes:

>And I'd also be interested at trying to get into assembly lang
>programming for 800xl. Where should I begin?

I made many attempts at learning 6502 assembler, all less than
completely successful -- until I got the right stuff. This stuff was right
for my own needs, but it may not be exactly what you need (based on your
programming experience, learning style,etc.) -- but it probably isn't a
bad place to start.
Get the Mac/65 with Toolkit package from B&C ComputerVisions
(408-986-9960) -- it is item ATD313, and the price is $59.95. This gets you
a Macro Assembler, a nice text editor, and a great debugger, and the toolkit
gives you a great starter macro set (including most functions from BASIC).
Then, get Atari Roots by Mark Andrews -- if you can find it anywhere.
I tried many books ("How to program your Atari in 6502 Assembler," "Atari
Assembly Language Programmer's Guide," The tari Assembler," etc.) and
found all of them lacking. Each gets the reader to the point of doing
addition, subtraction, multiplication, and division in assembler -- but does
not go into printing, setting up graphics modes, drawing, doing sound, etc.
In other words, they teach you FAR, FAR less than even the hublest book on
BASIC does for that language. Atari Roots goes into all of that stuff, and
the book's style is well suited to me. Atari Roots is also the only book
I know of that deals specifically with the Mac/65 assembler (in addition to
the ATari Assembler/Editor and ATari Macro Assembler).
Other useful resources, once you have the above, are "The Master
Memory Map for the Atari," "Compute!'s Mapping the Atari," and even the
Atari Assembler/Editor manual.

Good luck in your exploration of Assembler.

>ANSI color terminal emulation, picture viewing, or any other graphic
>enhancements.

James King insists the XEP-80 handles 9600 baud well. And, really,
that is plenty fast for most any online application other than downloading
large programs or viewing files while online (and since we're just talking
about 80 column text, neither of those applies)(oopp..meant, "viewing
graphic image files while online", above).
Sure, it doesn't do color, but that's not a major big deal...at
least not to me. With FT-80's support of emphasized and blinking text,
you still get the necessary information. Color is nice when online, but
to me it isn't needed enough to justify grafting a new graphics chip on,
and supporting that mod with software.
As for picture viewing and other graphic enhancements, you'd said
(or at least implied) that the main reason for upgrading graphics chips is
to gain 80 column text. Since these two don't fall under that, I won't
debate their merits.
Does the XEP-80 support underlined, blinking, and/or luminance
levels in its text output? Can one change the font? If the answer is
no to either of these (especially that last one), then I see a very good
reason for it not to have been supported better. These things are
necessary for a robust terminal program (supporting the extended ASCII
characters, for instance).

Memory is more important for a reason. An extension to the OS that
allowed programmers to build larger programs more easily or just using
the flat memory model of the 65816 would have facilitated many projects.
That as many apps have arrived that make their own unique claim on banked
ram for direct data storage is a testament to the programmers' ability to
withstand the torture it is to manually manipulate banked RAM. Believe
me, it isn't easy. And programs like Action! aren't well suited to this,
it really requires direct assembly.

: for a standard Atari8, forget the high level languages. I agree that it

It should be noted that a good deal of the reason for code bloat and
resource hungriness of more current software is because of the storage
and manipulation of higher resolution and higher color data. This would
not be as much of a problem with the Atari.

Another reason is by "throwing in the kitchen sink" rather than
and using shared resources.

So those of you that have seen sluggish PC apps that require Pentiums,
that when you remove the OS lag, the graphical requirements, and the bad
programming, you might actually be able to reduce it down to something
bearably fast on the Atari. Not rendering or other brute-force tasks,
but probably for everyday apps.

1672. Re: MAC Atari 8bit emulator

Goody, looks like the closest I'll get to an Atari emulator on this OTHER Jay Miner machine (Amiga) is going to have to run on my MAC emulator (Shapeshifter: which, at present, is so graphically slow as to be only usable at 1 bitplane). Rest of the throughput is fine, though. That's because Jim Drew is doing the usual thing about announcing emulations and then never delivering.

I just find it ironic that it'll take 2 levels of emulation for a machine that was always the best-suited for emulating the Atari, to do it.

It'll never be as fast as a native Amiga program emulating the Atari would be because things like PMGs and DLIs will get interpolated into blits and not into sprite and copperlist calls.

Someone's been talking of porting STXformer and I warned him that he'd have to remedy the PMG, sound, and color portions to take advantage of what the Amiga can do vs. a dog standard ST.

1673. R: handler for SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-30 00:00:00 UTC
From: bruck@avoda.jct.ac.il
Message-ID: <9507302045.AA11011@avoda.jct.ac.il>
Source record: 89545

I've figured out that SIO2PC can be used as a null cable.

Another user said it can also be used to connect the SIO directly to a modem, but HOW??? The plug won't just fit the modem, because both it and the socket in the back of the modem are female 25-pin connectors. Is all I need a gender changer?

And, whether I use it as a null modem or as a modem connector, I need an R: handler to support it. Now, this thing is plain enough that I can boot the R: handler from my 850 interface, turn it off (after the R: port has been opened), and use the SIO2PC as if it were a connection through the 850. This has two problems:

(A) I need the 850 on to boot the R:, and when opening and closing the channel (like when accessing a disk drive or sending a Break).

(B) The 850 handler doesn't support 19.2 Kbaud, while the SIO2PC hardware can use this speed.

Is there a disk-only R: handler that will solve these 2 problems?

Thanx

> if it could be done just for the blue layer.

> Powdered <toastman@armory.com>

This is, in fact, an excellent idea, because the mode 10 takes up all the color registers, while mode 9 just needs one.. So the colors don't actually ever have to be changed, just GPRIOR!

What I mean is that the color registers can contain shades of blue ALL the time.. Like this:

Red line: background red, GPRIOR mode 9
Green line: background green, GPRIOR mode 9
Blue line: background *black*, GPRIOR mode 10

The other 8 registers are IGNORED in the red and green lines, so they don't EVER have to be changed!

Of course, this leaves the black areas brownish, and the idea for making areas black with PM graphics falls apart (PM and mode 10 use the same color registers), but I still think it's worth a look!

1675. New Term80 software from CTH

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-30 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Jul30.190821.24806@wariat.UUCP>
Source record: 89547

I just downloaded Tom Hunt's new Term80.arc from CTH. Now,
this is a beta version. Only works on BB or MIO at 14.4k
baud and a ram-disk or hard drive. He's looking for beta
testers to get back to him with their experiences. So, if
you have a BB or MIO and 14.4k modem, I'll try to send you a
copy of this arc if you e-mail me. If CTH (419-368-4413) in
Ashland, Ohio is bad for you to call, I'll try to relay
messages concerning your experience with term80.arc to him.
This program contains y-modem g up/downloads.
I don't think it would be good to put on a ftp site just
yet as it is a beta version. And I think it would be best to
let Tom decide when to put it on ftp site.

1676. Re: Modifying Atari 8-bit Systems

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-30 00:00:00 UTC
From: jharris@cup.portal.com
Message-ID: <142905@cup.portal.com>
Source record: 89548

> James King insists the XEP-80 handles 9600 baud well. And, really,
>that is plenty fast for most any online application other than downloading
>large programs or viewing files while online (and since we're just talking
>about 80 column text, neither of those applies)(oopp..meant, "viewing
>graphic image files while online", above).

Downloading doesn't require a fast text display speed, so the XEP-80 wouldn't be a problem there. However, 9600 is half the speed needed to keep up with incoming text from high-speed modems. That falls short of my definition for "plenty fast". It will be even worse if someone ever produces a better serial interface capable of speeds greater than 19,200.

> As for picture viewing and other graphic enhancements, you'd said
>(or at least implied) that the main reason for upgrading graphics chips is
>to gain 80 column text. Since these two don't fall under that, I won't
>debate their merits.

Despite what may have been implied, I originally stated, and still agree with the additional enhancements that an upgraded graphic chip could provide. Even if 80 column text were the most important reason for upgrading, that does not diminish the value of the other enhancements -- enhancements that the XEP-80 did not provide.

The XEP-80 provided a mediocre 80 column text ability, had several bugs or limitations in its E: support, and didn't offer much else. I wouldn't have expected it to be as popular, or as well supported as an enhancement that provided much better and faster support in addition to higher res and higher color graphic capabilities.

> Does the XEP-80 support underlined, blinking, and/or luminance
>levels in its text output? Can one change the font?

Underlined - No
Blinking - No
Luminance - No
Fonts - Only between ATASCII graphics and Int'l characters.
Basically, matching the built-in fonts of the Atari.

Hello all, I'm looking for 4-6 1050 or Xf551 drives. I need working drives with power supplies. If you only have one drive that's fine, just mail me your price (including shipping). Payment can be made just about anyway you wish but I prefer COD (I'll even pick up the tab for that). Finally netrefs are available if you want them.

Thanks,
Nick

> to load, or list programs. Any help would be greatly appreciated.

It's quite simple, really. To load a BASIC program, type RUN"D:filename.ext

for any binary programs, you'll need to find a disk with DOS on it, since
they won't load without it, unless they have an auto-loader which runs it
once you turn on the computer. Make sure you're turning off BASIC when you
load a binary program by holding the 'OPTION' key when you turn the CPU on.

THE INSOMNIACS VIDEOGAME AUCTION!!!

HELP!!! I have so many video games, I cannot seem to sleep
at night. Please buy them now and save me from permanent I
NSOMNIA!!!

This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

Remember to bid high and bid fast because if you donUt, you
may miss your opportunity to own the games you really want.
And above all, remember to have fun!!!

The rules to this auction are at the end of this message.

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Air-Sea-Battle, box is damaged $2.00 min

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $3.00 min

-Space War $3.00 min

Atari 2600-LOOSE GAMES

-Adventure

-Armor Ambush

-Basic Math: Atari, cx-2661

-Bowling: Atari

-Boxing: Activision

-Canyon Bomber: cx-2607

-Circus Atari: Atari

-Chopper Command

-Codebreaker

-Crystal Castles: Atari $2.00 min

-Defender: Atari

-Demon Attack

-Enduro: Activision

-Flag Capture: Atari cx-2644

-Freeway: Activision

-Ghostbusters: Activision $3.00 min

-Home Financial Decisions

-Household Budget Management $1.50 min

-Hunt The Wumpus

-Meteor Multiplication

-Moon Mine

-Multiplication 1

-Munchman

-Music Maker

-Number Magic

-Parsec $1.50 min

-Pac-Man: Atari $2.00 min

-Percents

-Personal Record Keeping

-Personal Report Generator

-Scholastic Spelling Level 3

-Story Machine

-Super Demon Attack

-Terminal Emulator II w/box, directions $4.00 min

-The Attack

-Touch Typing Tutor

-Tunnels of Doom

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for
them, but I will not guarantee that I find them. Shipping
will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari Ultra Pong Doubles $4.00 min

-Atari 2600 jr, no cables does work $4.00 min

-Atari 2600 jr, no cables does not work $2.00 min

-Atari 2600 Paddle Controllers $1.00 min

-Atari 800XL, no cables $8.00 min

-Atari 1200XL no cables $8.00 min

-Atari 1050 Disk Drive, no cables $8.00 min

-Colecovision, w power supply, joysticks $8.00 min

-Commodore 64 Computer, w/ power supply, in box $10.00 min

-Commodore 1541 Disk Drive, w/ cables $10.00 min

-Intellivoice for Intellivision Systems $6.00 min

-Odyssey2 in box with cables not working $1.00 min

-Texas Instruments 99/4A box + cables $10.00 min

-Texas Instruments 99/4A Speech Synthesizer $6.00 min

ATARI 2600-excee + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified and systems have been tested and
do work unless they have no cables or power supply.
.
10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signnifies your consent
to follow these rules as stated.

1685. Re: Help...Just bought an 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC

Message-ID: <199507310610.XAA21649@zippy.sonoma.edu>
Source record: 89557

Hello - it sounds like the disks you're trying to load aren't bootable disks. If they're simply "disks with stuff on them", not, say, a commercial disk you'd buy (like, say, "BoulderDash").

You'll need to find a bootable disk there somewhere (something with a DOS- commercial games usually have their own DOS system (which is not very powerful) written for them and you can't access it).

Once you've got a DOS loaded, to load binary games, boot like this:

Turn on drive
Insert bootable DOS disk
Press and hold OPTION
Turn on computer
Release OPTION after a few moments (once it starts loading (beepbeepbeep))

A DOS menu (or prompt, if you're using some DOSes like SpartaDOS) will appear. On every since DOS I've seen which uses a menu, these commands seem to appliy:

A. (sometimes also/or a number) - show files on the disk
L. load a file

If you want to load a BASIC game, boot like this:

Turn on drive
Insert bootable DOS disk
Turn on computer

Type: RUN "D:filename.ext" to load and run a program, or:
LOAD "D:filename.ext" to load, and then
RUN to run
Also: DOS to get to DOS
BYE to get to the self-test, from which
you may press RESET to reboot (and hold
or don't hold OPTION - if you don't want
or want BASIC)

Good luck!

The popular (in the US, at least) DOSes include:

MyDOS 4.53 - very Atari DOS 2.5 (the old "standard") like -
runs most programs which can run with DOS 2.5
but it's much more powerful
SpartaDOS 3.2 - very powerful but not as compatible with DOS 2.5
(not only with disks but also with which programs
can be run with it)

I'd stick to MyDOS unless you want to run a BBS :)
Both handle hard drives and/or disks with up to 16MB of space, if you care.

What!? Glenn, I hope you don't think Action! compiles the same way that
I think TurboBASIC XL does - where the runtime is not only supplying
basic routines, but is also going through the code and interpreting it..

Because if you are, you're WRONG.

The ONLY reason you need to include the "runtime" package in Action! is if
you are going to distribute the program - the cartridge ROM holds all
of the built-in routines (Print(), SetColor(), Graphics(), MoveBlock(), etc.)..

That's where the RUNTIME.ACT file comes in - it redefines the built-in
routines (which the compiler simply defines as jumps to certain locations
on the cartridge) into real PROCedures and FUNCtions .. for speed, (probably
not only when it comes to their execution speed, but also their compilation
speed) the routines are simply stored as blocks of data (executable code,
in this case, of course).

If I write a program in Action! and compile it, I can run it from DOS,
from another Action! program, from BASIC (if it works, as is the case with
any other standard binary .COM file)... the thing is, just like programs
that rely on the OS's resources, Action! programs (which aren't compiled
with the RUNTIME.ACT file) reply on the Action! cart's resources sitting
in memory..

Get it?

Also - I think Quick died for two reasons:

(1) 40 (or was it only 38!?) chars. per line in the editor and compiler
Trying to do things like STRCPY() and PRINT() were complete pains in
the rear! - having to split and re-split lines left and right! >:^[
(2) The environment - it was a nice one, but unstable. <:^[Perhaps
if it were on ROM like Action! is? :)

Finally, even the Quick manual admits the Action! is faster than Quick..
The top three fastest languages they stated were:

#1 Assembly (of COURSE!)
#2 Action!
#3 Quick

1691. PRINTER INTERFACE FOR ATARI 8-BIT

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC
From: rmax99@ix.netcom.com
Message-ID: <3vi3p3$g6j@ixnews2.ix.netcom.com>
Source record: 89563

American Techna-Vision has a good stock of the MicroPrint Printer Interface. This allows you to connect any standard Parallel Printer to your 8-bit. Works with all 8-bit computers except the 1200XL. Includes instructions on how to modify the 1200XL to work with this interface. American Techna-Vision also has a large stock of replacement parts, commercial software and books. To obtain a catalog phone 510-352-3787.

1692. Low Cost PRINTER INTERFACE for Atari 8-bit

American Techna-Vision sells the MicroPrint Interface for only $14.95. It allows you to connect any standard Parallel Printer to your Atari 8-bit. Works with all models except the 1200XL. Includes instructions that allow you to modify the 1200XL to work with the interace. They also carry a large number of replacement parts, commercial software and books. To obtain a catalog phone 510-352-3787.

1693. detection of DOS by programms - HOW ???

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.242.000CD843@genesis.informatik.rwth-aachen.de>
Source record: 89565

Hello !!!
My problem is the following:
To get my next program running with all DOS, I need to find out, which DOS
is actually in the machine .
Is there any POKE to get the whole name or are there different methods ?
I'm especially interested in

SpartaDos 1.X, 2.X, 3.2 f/g(x), X
BW-Dos 1.X
BiBoDos 5.X,6.X
OSS-DOS
Atari Dos 2.0, 2.5
MyDos 4.X
Turbo-Dos

Thank you very much !

Matt
Please send personal mail - It's easier to me to keep the information.

1694. High Speed SIO routines of Happy/Speedy

1698. Rainbow at InfoMac

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC
From: lamcw@aston.ac.uk
Message-ID: <DCKz0w.Hzx@aston.ac.uk>
Source record: 89570

Hi,

Just a quick note to say that the Rainbow demo is now at
InfoMac at

ftp.amug.org info-mac/rec/rainbow-demo.hqx
/app/rainbow-demo.hqx

People looking for some software may like to try

wuarchive.wustl.edu /systems/atari/umich.edu/8bit

The Xmission site has, as I believe, passed into folklore.

Finally, regarding ROM images. Please don't ask me for them;
I can't send them.

Good luck,

Chris Lam.

Mark Statzer writes:

>What's the point of a new OS, new CPU, and a system that's not backward
>compatible to Atari-8 users? If you can't run the old software, it's not an
>Atari anymore! If you want to build a new computer from scratch, have at it.

Once again, let me harp on the "can't run the old software" phrase. This statement implies that you've made some bizaare modification to your 8-bit and, unless hell freezes over, there
ain't no way that you're going to be able to run your classic 8-bit software.

I'll say it again: that notion is garbage. When you reach the point in the day at which you'd
like to run M.U.L.E or AtariWrite Plus or whatever, you would perform the following steps:
1) turn off your computer
2) insert your program floppy
3) turn your computer on.

At this point you will hear a beeping sound that indicates that the desired CLASSIC 8-bit program is loading. The above steps, I might add, might remind you of what is CURRENTLY required to switch from one program to another. It is my opion that if the program you are switching FROM happens to be a new OS running up-to-date software, well... you've gotten something for nothing and that's good.

But then, I might be crazy or something....

>fast as if you had hand-coded the ML directly. It's possible that I'm mis-
>sing something, but if so, I don't know what it is and you should now en-
>lighten me!

I think you've answered your own question, there, Chris. C is a -compiled- language and this
means that each C statement translated to MANY machine instructions. In fact, it generates many more than are really need to accomplish a given task. It has to. Even the most sophisticated optimizing C compiler can't alter it's basic code-generating algorithm to solve a
particular problem.

In machine language, on the other hand, the programmer is interacting directly with the system
and knows what the bare-essentials are for his program.

Consider this:

```
void main()
{
int i=0;

for(i=0; i<10; i++)
{
printf("Hello there.\n");
}
}
```

Even this SIMPLE routine would require MANY MANY MANY more lines of code than it's machine language equivalent. Granted, the PRINTF function is more sophisticated than what you'd probably use in ML (in this case, a call to the CIO), but the point here is that it's OVERKILL;
you don't NEED all of PRINTF's capabilities so you're WASTING MEMORY. No so in ML.

Hope this clears things up.

Source record: 89574

I don't think Quick is dead, it is just not very well supported in the USA. It is quite popular in Europe, more especially Germany where it originates from.

I have done a bit of programming in Quick and I find it very good, indeed I have a couple of games in the pipeline both of which will be written in Quick. My opinion is that it is more suited to programming games rather than utilities and it has quite strict rules for which portions of memory you can use but they can be worked around with a bit of care and knowledge. The software is disk based and both the editor and compiler are stored in memory at once, the editor looks nice but is not too clever when you are searching/ scrolling through a big program.

If I were a betting man I would wager more commercial games have been written in Quick than in Action!, I could be wrong and I don't want to start an arguement, but thats my feeling anyway. Plus Quick is only #15, whereas Action is $45 (#30ish)!

Glenn Saunders <krishna@primenet.com> wrote:
>
>The Atari8 is just plaing cramped. 64K limits are a problem! Don't fool
>yourself.

It depends what you want to do. I do a lot of writing on my PC clone and I keep files less than 20K or so. Not because I'm anal retentive or that 20K is some magic number; that's just the file sizes my normal way of keeping things mentally managable happens to result in. I know there are applications that would be easier to write in more memory, things like FAX programs, desktop publishing, huge databases, etc. But I honestly don't use anything like that, mostly because I think such software is overkill for my needs.

Possibly a good approach to writing a new OS would be to come up with a list of software that people *must* have for their Atari 8-bit and that would require oodles of memory or other OS features. I know some people would like an ANSI C compiler, but, realistically, is anyone really gonna write it? And is it necessary? Probably not.

I just DLed the Rainbow demo from Info-Mac and I must say that although Rainbow is probably very good, I can't run it on my Mac. Rainbow wasn't sent with the ROMs. Ok..I understand that. My problem is that I have an 800 and an 800XL but I don't have a monitor/TV for it anymore. I haven't used it in ages. I'd like to DL the ROMs from the 800XL except the demo version doesn't work with the 800XL ROMs! I also don't have an 850 connector (never needed one).
Since I own an 800 and 800XL, I don't think it would be an infringement on copyright if I can ask someone to send me the ROMs. I would just like to be able to TRY the demo before I shell out the $$$ for it. I also will need to drop $$$ on an 850 which I don't want to do unless I need it. Any help? I really don't want these 6 boxes of software I have to go to waste. Why not use a TV in the house? They're all wall mounted.

1709. Better than Star Raiders?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC
From: toastman@armory.com
Message-ID: <3vjh5a$k7l@news.scruz.net>
Source record: 89581

These questions concern the original Star Raiders for the 400/800.

First of all, the attack computer has this nifty locking-on device in the corner. If I get a ship aligned vertically, two little bars appear. If I get it in my crosshairs, two more bars appear. The third pair of bars signifies that I have a good enough lock to fire a pair of torpedoes right into the Captain's private john. Of course it seems to take a bit more than having something in the crosshairs to get that, and I was wondering what exactly it is?

Second, what factors determine rank upon the completion of a mission? Time? Energy usage? Firing accuracy? What?

Thank you.

The manual gave full info.

Two marks appear that indicate the computer has horizontally
locked your photons onto the target. Two more appear to
indicate the computer has horizontally and vertically locked
your photons onto the target. When two more marks appear on the
bottom of the Attack Computer Display, the target is locked in
horizontally, vertically, and is _within range_. This is the best
^^^^^^^^^^^^
time to fire your photons. Both photons will fire with a kill
probability of 90% guaranteed.

>Second, what factors determine rank upon the completion of a
>mission? Time? Energy usage? Firing accuracy? What?

Your rank and class are determined with this formula:

M + 6 x (enemy destroyed)
- energy used/100
- time/100
- 18 x (bases enemy destroyed)
- 3 x (bases you destroyed)

VALUES FOR M

Mission Level (Completed, Aborted, Penalty for Starship Destroyed)

NOVICE (80, 60, 40)
PILOT (76, 60, 50)
WARRIOR (60, 50, 40)
COMMANDER (111, 100, 90)

RATING MISSION SCORE
ROOKIE 48-79
NOVICE 80-111
ENSIGN 112-143

PILOT 144-175
ACE 176-191
LIEUTENANT 192-207
WARRIOR 208-223
CAPTAIN 224-239
COMMANDER 240-271
STAR COMMANDER 272-303

American Techna-Vision has a HUGE stock of Printer Interfaces available for the Atari 8-bit. The MicroPrint Interface by Supra is available in small to large quantities at extremely good prices. We also welcome sales to individuals in Europe, UK. For inquires phone USA 510-352-3787 or FAX 510-352-9227

1717. Q: How to connect a modem to an 800/800XL?

Newsgroup: comp.sys.atari.8bit
Date: 1995-07-31 00:00:00 UTC
From: DL10@cornell.edu
Message-ID: <DL10-3107952235220001@cu-dialup-0033.cit.cornell.edu>
Source record: 89589

Can anyone tell me how to go about connecting a SupraFAXmodem (14.4K) to either an 800 or 800XL? It's been a while since I've used my 8-bit machines - and when I did use them, I used a 300bps modem that simply plugged into a joystick port. Now, I'm interested in transferring a large number of files over to a Mac and would obviously like to avoid using the slow 300bps modem. (This 14.4 is just a spare I have lying around - so I figured it might be put to good use.)

BTW, I do not own an 850 interface - and if I can avoid having to buy one (or any other equipment for this one-time use), I'd obviously prefer it.

Thanks for any advice.

I don't see the relevance of your statement that 9600 is half
the speed needed to keep up with incoming text from high-speed modems.
Heck, my IBM-based BBS runs at 28.8Kbaud, and I have four or five users
who call in at 2400 baud, all with no complaints. They're still getting
2400 baud, as that is what my modem sets itself to during the handshake.
So, if, in our case, 9600 baud is faster than you can read, that should be
plenty fast enough for text applications. Unless, of course, I am missing
something. :)

>Underlined - No
>Blinking - No
>Luminance - No
>Fonts - Only between ATASCII graphics and Int'l characters.
> Basically, matching the built-in fonts of the Atari.

Ah, that is a shame. No chance for decent terminal emulation, then.
Text enhancement isn't absolutely necessary, but it helps since many online
services use those things (in the absence of color support) to aid in
differentiating meaning (ie, emphasized for commands, normal for posts, etc.)

Okay, I understand now. Sorry, Powdered, I don't know your background in Atari programming. Yes, switching from GR.9 to 10 is lots faster. My pixel color routines will have to be unique for blue then (8 levels rather than 16).

Maybe with a 65816 the color changes would get done in time...

|> > A long while back I dreamed up a "chroma killer" circuit change. It
...

That's tougher, but doable. It would be easier on a split luma-chroma output Atari.

Uhhh... arguably bright red *is* pink. Do you mean saturated red?

..
|> He actually made that? Where is it?

He did make it. It's available on GEnie, from a year or two ago. Seems to me it had the name "black" in the title.

>overkill for my needs.

It sounds like you use computers as I do. I happen to have very,
very few needs for a computer beyond what a stock 130XE can provide. Heck,
there is only one need I have for anything beyond a stock 64K XL: compiling.
And even that is just a convenience of time. (errr..assembling! not compiling,
I have to switch out of C++ mode![G]) I say it is a convenience because
assembling from floppy to floppy takes about as long as compiling C source
used to take on my 386SX-16 (course, those C programs were MUCH bigger than
the stuff I do on Atari, but still...).

But for word processing, spreadsheets, databases, graphics work, and
the other tasks I have for using the computer, 64K is plenty.

>Possibly a good approach to writing a new OS would be to come up with a
>list of software that people *must* have for their Atari 8-bit and that
>would require oodles of memory or other OS features. I know some people
>would like an ANSI C compiler, but, realistically, is anyone really gonna
>write it? And is it necessary? Probably not.

It would make my life a lot easier if there were instantly to appear
before me a fast, comprehensive C compiler for the Atari8. I could give up
learning assembly! :) But, once I put the effort into learning Assembly
that I did in learning BASIC and C before it, I'll be in good shape. And,
as you said, it is unlikely that anyone is going to implement a full ANSI C
compiler on the Atari8.

Actually the points lost ffor destroying your own base are less than if the enemy does it. In a situation where it is too late for you to stop the enemy, the manual suggests you destroy it yourself. Destruction of a starbase also generates new enemies for you to destroy, so I'm not sure how the final total would be affected.

That's my POINT!

As for black areas being brown, it would be less noticable
than a bright blue. In fact, it has been my experience that
zero-luma colors are often darker than black itself on my TV,
except in the blue hues.

1726. 9600 bps and text ....

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-01 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3vk2cm$8ui@nic-nac.CSU.net>
Source record: 89456

Remember the following things in regards to 9600 vs. 19.2k (14.4k) bps
and text speed with terminals:

1. Reading text at 9600 is fine, but...
If I can textually only keep up with 9600, I will be FORCED to log-in
at that speed or deal with losing data when it appears on my screen.
This is not a problem, EXCEPT I'd like to download stuff as well.
If I have to log in at 9600 to see what files I have to download,
then I'm stuck downloading them at "1/2" the speed my expensive mode
can support.
If I have to log in at 14.4/19.2k bps to download files as fast as
possible, then I'm stuck being unable to read stuff on my screen.

2. I can't keep up with TEXT moving at 9600 bps, but...
ANSI and VT codes are also sent to a terminal and need to be kept up
with by it. Try running "tin" or "elm" or "lynx" at 2400 compared to
14.4k. After you've done it at 14.4k, you'll not want to suffer anything
slower!
Some text isn't WORTH reading:
Message headers
Long menus (when you KNOW where you want to go)
Screen redraws (a message comes in and you have to [^L] the program,
or you [^Z] (stop) a program and then return to it and it automat-
ically redraws, etc.)

>I< want a modem interface capable of 19.2k bps or higher, and I'm also
>GLAD< that things like Ice-T and Flick80 exist which go faster than XEP80's
and do more things, screen-wise!!!

Thanx Itay! Thanx Earl!

Color changes? It's barely a tougher task than clearing the
screen. Just go through the blue layer and give each byte an
ROR and an AND #$77. Unless of course you meant changing color
registers for three-gr10 mode.

And for the record, I have very little background in Atari
programming though before I knew ML, I knew how to make a DATA
statement into a DLI. I figured out what 169 and 141 and 96
meant and such. But that was it. The way I came up with
this, I looked through the file in REFMAN.ARC. It's amazing
how easy graphics stuff on the Atari can be. Of course it's
just as amazing how difficult the XIO system looks.

I really need to lose the handle, don't I? heh. nobody will
take me seriously.

1731. 8-bit computer equipment -- FOR SALE/TRADE

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-01 00:00:00 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <3vks62$ep9@usenet.INS.CWRU.Edu>
Source record: 89461

updated 07/31/95

I have the following 8-bit computer equipment for sale or trade. The list includes systems from Atari, Commodore, Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Snail. The shipping cost depends on both the weight of the package and the distance that it is traveling. The buyer has the choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

* = (after price) Tentatively sold/traded. Inquiries welcome.

*****

LOT #1

ATARI 400 COMPUTER with RCA cable, and 410 Data Recorder.

This is a complete system, except for RF switchbox and power supply.

writes:
>If so, you might try re-inking it somehow.

To re-ink a 1027 ink roller you'll need to purchase an ink-pad
re-inker. The one I used had a little roll-on ball on the top.
Take the ink roller off the 1027 and roll ink onto the roller.
Apply ink to the entire surface of the roller - do this until
the thing is fairly saturated.

Have fun!

>The software is Infosoft 5000 v.5.3 (c) 1986 INFO/soft technology, Inc.
>Seattle.

This is an Atari8, and an early version of the software I wrote. The InfoSoft 7000, also done in 1986, is the software that allowed mixed Gr8, Gr7.5, and GTIA graphics on the same scanline. (Like the Our5oft demo). Otherwise, the software was pretty crude and used only Atari standard text modes with redefined csets. Large letters were drawn with multiple characters, much like using Ctrl-graphic characters.

Cuurent versions use the Gr.8 mode and have many font sizes and styles. All fonts are proportionally spaced and fully auto-kerned based on the graphic shape of the character. The primary uses are cable TV and hotels, but there have been a few othre uses over the years. Here's some of them:

The arrival and departure schedules in the Maui airports. (Hawaii)

An on-screen program guide used in some cable systems.

An electronic newspaper, and classified ad network.

Thought I can't personally confirm it, I was told that IBM used a version of my character generator in its corporate headquarters. I always thought that would make a neat Atari advertisement:

"What IBM uses when _they_ get down to business."

Bill; It's gotta be the fumes! Long story without a real point: I helped my brother-in-law get through SJSU by doing a mix of tutoring & his homework. He's now teaching in a Jr High school in Mt View. Don 't know why, maybe it's that "No good deed goes unpunished" thing, but he talked me up to the faculty there. Said something to the effect they needed a responsible adult to help with the computer lab & if I didn't shoot my mouth off, they wouldn't know the difference. I got to talking to the teacher in charge, after she said we're getting in Silicon Graphics work stations next year, laughed & said they refuse donations of anything less then a '386, indicated if I do what they'd like me to do I could mix in what I like to do; I said I'd volunteer! Really, it was the robotics I envisioned running off an Atari that sucked me in. My B-I-L is a little upset with me. Mostly he was happy, but his intent was that I get hired vs giving it away for free. I sort'a hope things work out, when I told her I only work FRI-SUN nights she said something like "Great, that means your available 5 days a week!" Seems to good to be true, I've never done anything in my life to deserve to be this lucky. Something will probably happen though. Last time I tried to do something like this at a local school, they had a teacher with a valid California teaching credential offer to do the job for $6.85 an hour! I expect the same thing will happen here if they decide to make it a paid position. Such is life, but I'm planning on enjoying myself in the meantime.

Well I managed to get the new Atari emulator for the Mac to work. Used the ROM found in PC Xformer 2.5. Seems amazing after all these years to see the Atari Logo on my screen again.

Now the question is how to get all the old games from my Atari 800 over to my Mac. Any suggestions?

I have an old disk drive which still kind of works, and cartridges of such games as Star Raiders, Blue Max, etc.... Are any of these programs on the net in a form useable by the emulator? What are the copywrite issues? Finally, how do I go about getting them off of the Atari and into the Mac?

Thanks in advance,

-- Harold

okay, now I understand what John Harris was getting at. The only
things I can add are: 1) I don't download very frequently, so that didn't
even enter my mind :), and 2) When I do download, I'm downloading Atari8
stuff (any IBM stuff I have is *uploaded* to my BBS by users who want to
download from me in return), and with the size of Atari8 files, 9600 baud
isn't the handicap it is in the IBM world, where anything less than 1 MB
is considered worthless[Grin].
Nope, those arguments don't hold true for many, but at least they
explain why I missed that. :P

>2. I can't keep up with TEXT moving at 9600 bps, but...

> slower!

Actually, once you have a BBS and can access such stuff as ANSI-laden
door games locally, even 14.4Kbaud seems mighty slow. ;) Even so, I do
call out on my Atari (don't want to tie up the BBS) when I call here and to
BBS's other than my own, and the 9600 baud rate hasn't upset me yet..even
when I play ANSI games like Global War.

One of my favorites books has always been 6502 Assembly Language Subroutines
By Lance Leventhal. I used to just sit there, looking at those puppies
trying to figure out what was going on. Everything from two dimensional
word arrays to multiple precision binary division is in that thing. More
then a little info is in there one hardware interface/interupts. If I had
to chose one ml book to save in a fire, that would be it. It has a lot
of info on BCD math that you won't usually find in a straight Atari
reference. I think Philip Price cited it as one of his favorite sources
also. It kind of figures since most CRPGs are just a fancy data base.
Bill, in my life I've had to use floating point twice from ML, & maybe
twice from Action! for some specific translations of graphic demos from
basic. It's just not a floating point world out there! Once you make the
conversion from floating point to integers it become like a religious
thing. For instance, I don't eat 1/6 of a pie, I have one slice & 5 are
left. I don't have a 1/4 of a tank of gas, it's enough<some people may
argue this> to get me about 50 miles. I never have $.75 in change, I
have 3 quarters. It's good that the FP access from Action! is enough
of a pain that not many people use it. It's a great way to get a program
that runs so fast it sings to slow down to the point where it grunts.

To: lamcw@aston.ac.uk
From: andersonp@jeflin.tju.edu (Paul A. Anderson)
Subject: Little Mac Atari Emulator Problems
Date: Tue, 1 Aug 1995 14:56:39 +0000

Great job, I tried out the Atari emulator last night and it works
fantastic. I just wanted to let you know of two problems with the ROM
transfering.

1. Due to a bug/typo when sending the original Atari OS to ROM, a patch is
required to properly access the 850 interface's serial ports. It was
distributed with most modem software as a 1 block AUTORUN.SYS and is needed
to use the BASIC XFER program on early 800s otherwise you get an error 130
(invalid device) when trying to open R: in line 220. This may also confuse
some people as BASIC will drop out of execution with the error without
allowing the final POKE to turn the screen display back on. This bug may
have been fixed in later Atari's but I don't remember if and when...

2. There is an error in the XFER program that causes a type 3 error (value
error) when trying to PUT a byte to #7. This is a result of negative values
in the B array caused by adding 48 to HI before calculating LO. The program
should read:

```
40 HI = INT(K/16)
50 LO = (K-HI*16)
55 HI = HI+48
56 LO = LO+48
```

Other than dropping transfers down to 4800 baud for reliability, once I got
the ROM over to the MAC everything worked great!! It's pretty fast to
(especially since they said it could'nt be done in C ;)) Now I'm on my way
down to the bank to get a money order for pounds so that I can get the full
version and start digging up the thousands of games I accumulated years
ago...

Later,
Paul

1742. IceT & 850 Setup Q's

Newsgroup: comp.sys.atari.8bit

Okay, I just got an 850 interface, and I'm trying to log in to a local freenet - but IceT (which I've never used before) tells me there's no modem handler installed. I read the readme for IceT and it says I should have gotten a handler file with the 850 (I didn't - Frank, do you know anything about this?). Bobterm loads some sort of handler directly from the 850. So what do I do to get IceT to work? Or is there a better comm package that suppports vt100 that I'm not aware of???

>Rick

I used to run a BBS and had this problem a lot, but I remember the pad character as being somewhat random, definitely not always ASCII 3. The worst case was when it padded with the same character as the last true character in the file. It was not a problem with basic programs, just ML and graphic files. I wrote a program to clean the padded characters out and a lot of files that crashed and burned ran perfectly after being stripped of the extra characters. If anyone wants it, it is at Umich in the CIS directories, or I'll send it email at request.

1744. Need value of pot on 800

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-01 00:00:00 UTC
From: bwillard@mindspring.com
Message-ID: <bwillard.55.00692D8E@mindspring.com>
Source record: 89474

Well, I just got an 800 to add to my collection. It is in perfect condition and works great, so of course, I wanted to fix it! There is a potentiometer on all Ataris to adjust the hue. With Salt II, you can set it just like the factory. Apparently, this one had never been moved, because when I tried, my colorful Atari 800 became monochrome. Since the pot shattered when I tried to move it, and since there is no value marked on the pot or the board, can anyone out there give me the resistance so that I can replace it? It is R 309 on the board inside the shield, but outside the regular pop-top. Thanks in advance.

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM,

ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

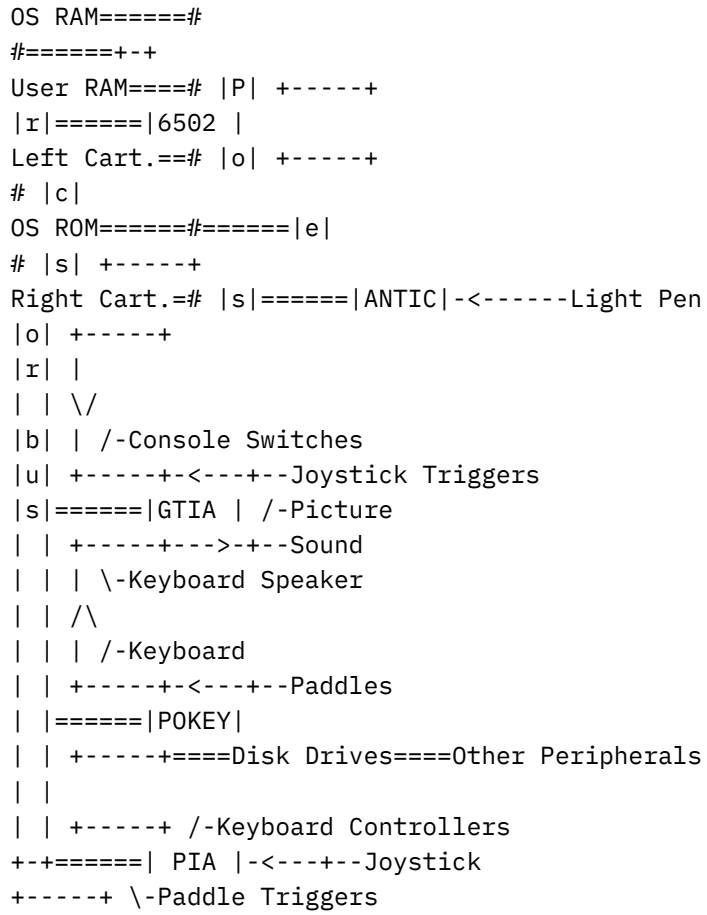
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexor. . According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL

can look like a 130XE with that 16-pin chip installed (That's right NO freddy)
and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text

2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

---

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

---

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu . Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu .

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu . The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn). Please

name the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you
get started using it, try this example of retrieving files from the Merit/Umich
Software Archives (through the barnone.citi.umich.edu mirror site). Send a
message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu ; the Atari Archive as a whole is
maintained by mailto:boydm@atari.archive.umich.edu (Mickey Boyd).

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
---
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)

ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by
mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos,
SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu .

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.html

Atari 8-Bit Home Page
Ivo van Poorten, mailto:ipoorten@cs.vu.nl
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
Marek Tomczyk, mailto:Marek.Tomczyk@stud.uni-karlsruhe.de
http://www.uni-karlsruhe.de/~un55/8bit.html

Big Atari 8bit Home Page
Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.html

Central Atari Information Network
Cleveland Free-Net Atari SIG, mailto:xx004@cleveland.freenet.edu
http://ace.cs.ohiou.edu/personal/mleair/cain.html

Rob Funk's pages
http://www.cis.ohio-state.edu/~funk/

CompuCat BBS
Neal Kinney, mailto:nkinney@netcom.com
ftp://ftp.netcom.com/pub/nk/nkinney/html/compucat.html

Classic Computer and Video Game Systems
http://www.gate.net/~cmwagner/atari8.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

If your local system supports AFS, this method of accessing the Merit/UMich Archive is a breeze.

Downloading

Just copy files from file:///afs/umich.edu/group/itd/archive/atari/8bit/

Uploading

Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

Subject: 7.9) What IRC channels discuss the 8-bit Atari?

#Atari8 - Just for 8-bit Atari users!

#classic - Classic Games and Systems Collectors.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.

Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

Merit/UMich: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

HereZs some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind

- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o

```
o o o o o o o o o o o o o
25 14
```

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

Major contributors to this section:

==> Atari 810
SS SD 19.2Kbps standard

==> Happy 810
SS SD Warp speed

==> Atari 1050
SS SD/ED 19.2Kbps standard

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) unknown DOS restrictions

==> Supermax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)

by Super products. Compatiable with superdos and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

==> Trak ATD1
SS SD

SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS

from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps

CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)

- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs

600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer

XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial
programs. I haven't heard anything about OASIS IV and CARINA for a while,
but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 13.6) What version of Atari BASIC do I have?

Subject: 13.7) What are the Standards for Used 8-Bit Stuff?

Developed by mailto:b.poehland@genie.geis.com (Ben Poehland)

When selling used 8-bit Atari equipment in the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group, please consider describing the condition of the materials you are selling using these standards. This will go a long way toward preventing potentially highly-contentious misunderstandings. Usage is voluntary, but recommended.

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging materials.
EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories; heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations, among many others:

Subject: 14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit Newbie / Stupid Question / Emulator Help FAQ" is maintained by mailto:kendrick@sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the PC Xformer 8-bit Atari emulator for Windows from Branch Always Software.

Subject: 14.5) What prominent Atarians are reachable by e-mail?

The "Who's Who in the Atari Community E-Mail Directory" listing includes people involved in all of the Atari computing and gaming platforms. This file is maintained by Len Stys, SIG Manager of the Cleveland Free-Net Atari SIG. Write to mailto:xx004@cleveland.freenet.edu (Atari SIG).

End of atari-8-bit/faq

1746. HOW TO GET ROMS FOR "RAINBOW" (ATARI XL EMULATOR)! The answer.

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-01 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3vjdif$mgt@nic-nac.CSU.net>
Source record: 89599
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit,comp.sys.mac.announce,comp.sys.mac.apps,comp.sys.mac.misc

People have been asking how they can get ROM images (OS and BASIC) for use with the new Atari 8-bit emulator, "Rainbow" for the Macintosh, by Chris Lam.

The ROM images found in the 2.5 version of "PC Xformer," the 2nd unregistered release of the Atari 8-bit emulator for PCs, by Branch Always Software are available as follows :

FTP to: atari.archive.umich.edu
or: amiga.archive.umich.edu ("cd" command doesn't work right)
or: mac.archive.umich.edu
etc..

The Atari 8-bit directory there is: atari/8bit
PC Xformer 2.5 (NOT 2.52!) is at: atari/8bit/Xf2/xf25.zip

Or you can simply Gopher there:

Gopher: gopher.archive.umich.edu
then: Merit Software Archives
then: Atari Archive (Merit Network, USA)
then: 8bit
{ then: Xf2 }

UnZIP the archive and rename the .ROM files appropriately and put them where Rainbow wants them. (Refer to the documentation which came with Rainbow.)

As to the rights of these files, I'm unaware who owns the rights, but I THINK Atari gave them up. (The 800 OS ROMs have been free ever since the 800XL was around when they produced the "Translator" disk which replaced the 800XL OS with the 800 OS so that some older programs could work properly).

For more information on Rainbow, point your Web browser Chris Lam's "Emulators" page:

http://www.aston.ac.uk/~lamcw/emulators.html

For more information on PC Xformer, point your Web browser to Branch Always Software's page:

http://www.halcyon.com/~brasoft/

For more information on the Atari 8-bit, point your Web browser to my (Bill Kendrick's) page:

My page:
http://zippy.sonoma.edu/~kendrick

New Breed Software:
http://zippy.sonoma.edu/~kendrick/nbs

The "Unofficial Atari 8-bit New User, Emulator Help FAQ":
http://zippy.sonoma.edu/~kendrick/xf2faq.txt

Other Pages (has links to other Atari 8-bit pages):
http://zippy.sonoma.edu/~kendrick/other/other.html

Note: The Emulator Help FAQ is going to need a major rewrite once I get
my hand on the latest copy of Rainbow, AND once I get my hand on the
latest copy of the Atari 8-bit emulator for Unix... <sigh!>

GOOD LUCK! REMEMBER- THE .ROM FILES ARE IN PC XFORMER 2.5's ZIP,
NOT PC XFORMER 2.52's ZIP!

Message-ID: <3vk1js$pfr@nnrp3.primenet.com>
Source record: 89601

I think the enemy has to remain in the crosshairs for a little while before the lock happens. This is, of course, dangerous because he is hurling P.T.s your way which requires dodge and weave, therefore instances of computer lock will be rare unless you decide to take some hits and keep him in the crosshairs.

The mortal Burnt Toast Man wrote:
: Second, what factors determine rank upon the completion of a
: mission? Time? Energy usage? Firing accuracy? What?

You need a manual.

It's based on mainly:

number of dockings
starbase losses
number if kills (if you die before completing a mission)
duration of game

I think if you intentionally skrag a starbase you automatically get the
lowest rank for being a traitor, but I'm not sure.

I just wish it were possible to also go after and skrag the repair/refuel
shuttle!

1750. Re: R: handler for SIO2PC

Newsgroup: comp.sys.atari.8bit

From: bmarcum@iglou.iglou.com
Message-ID: <DCLy74.IAq@iglou.com>
Source record: 89603

If the SIO2PC by itself works as a null modem, you will need a gender changer and a null modem to connect it to a modem. An R-verter handler should go up to 19200; of course you'll need to set the modem for software flow control (AT&K4).

My Atari 8-bit New User, Emulator Help FAQ is an ok start. It's not
that great for a lot of actual new user things (but that's why people
pose questions to me and I add them :)).

As for it being an emulator FAQ, unfortunately it's only PC Xformer
at the moment (that's why it was made, many Xformer users would pop up
here on c.s.a.8 asking newbie questions and the c.s.a.8 FAQ didn't help
too much)

If you have Web access, all of these are available to you right now!

My "Unofficial Atari 8-bit New User, Emulator Help FAQ" version 0.7:

http://zippy.sonoma.edu/~kendrick/nbs/xf2faq.txt

The "comp.sys.atari.8bit" official FAQs' locations were posted here today
and can be accessed (as well as other 8bit pages) from my "Other Pages" page
at:

http://zippy.sonoma.edu/~kendrick/other/other.html

Good luck! Two things:
"DOS" in BASIC gets you to DOS
OPTION while booting turns off BASIC (get to DOS right away)
from there, if it's DOS 2.5 or MyDOS or many other popular menu-based
DOSes, it should be easy

1752. Re: HTML viewer for 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-01 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3vk00a$76n@nic-nac.CSU.net>
Source record: 89605

References: <3vjrhj$epn@case.cyberspace.com>

I was working on an offline one. It's not TOO difficult of a task,
really. Some problems you'll encounter in making an HTML viewer on the
Atari include:

(1) How to do the text - plain text? Mixed text modes? How about
nice big Daisy Dot III (or DD3-style) fonts? I'd go for the latter.
(2) How do you get from one page to the next? You don't. You have
to fetch ALL of the HTML files you'd want to look at, download them,
and then view them. Yuk! See below. :)
(3) Inline graphics - GIF conversion on the Atari can be pretty slow....

Now, re: #2:

I have a plan to make a terminal-like program (perhaps you'll dial into
your system with BobTerm or IceT or Flick80 - exit back to DOS and then
load this program).

It will call a program (99% likely it'll be "lynx" for Unix/VMS/etc.)

It will tell the program to get an HTML file and return the SOURCE
(not the rendered data) to you WITHOUT being interactive.

The terminal will read this in (by now, Lynx has finished it's job
and quick back to the shell) and render it.

The user can do whatever - click stuff, fill out forms, quit, etc.
You're still logged in and still at the prompt.

Pretty cool, huh? I heard that I-Comm for Windows does this.. pretty
neat.

BTW- to get lynx to send you an HTML (which will be dumped to your
terminal or to a file or program if you pipe it to one) just run it
as: "lynx -source -dump THE_URL" instead of just "lynx THE_URL"
or "lynx" and then opening ([g]oing to) "THE_URL"...

Atari gave up the rights due to the translator disk? I think this is wrong, but I really don't know for certain. I am pretty certain Atari maintains control of all the 8 bit code and will maintain ownership.

Considering the Atari legal dept. has been the sole profit generator for the company for the last 11 years now, I would look into this.

Jerry

1754. Re: Rainbow at InfoMac

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-02 00:00:00 UTC
From: lamcw@aston.ac.uk
Message-ID: <DCoJ6L.FMF@aston.ac.uk>
Source record: 89476

Hi,

;I just DLed the Rainbow demo from Info-Mac and I must say that although
;Rainbow is probably very good, I can't run it on my Mac. Rainbow wasn't
;sent with the ROMs.

I was deliberately cautious about what software I included with Rainbow.

I would like very much to include the ROMs and DOS 2.5. I have written
to Atari UK about it and their reply was 'persuade us by saying what's in
it for Atari' (I'm paraphrasing)

I received an email from someone saying the the ROMs were released into
the public domain 3 or 4 years ago. Now, I certainly need a bit more
evidence than this so I will try to contact Atari again. If anyone
can help with this, I would be grateful. I will write again to Atari UK
to clarify the position.

Sorry to all those who are finding the lack of ROMs a problem. I feel
that including the ROMs, although nice, doesn't help Atari users much.
He/she will still want to get their favourite software from the 8bit
system to the Mac. The solution I proposed was the 850 unit. Other solutions
may be possible e.g. via modem or adaption of the SIO2PC cable.

Regards,

Chris Lam.

1755. INSOMNIACS VIDEOGAME AUCTION DAY 2

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-02 00:00:00 UTC
From: jrm8248@u.cc.utah.edu
Message-ID: <3vms4b$ai2@news.cc.utah.edu>

THE INSOMNIACS VIDEOGAME AUCTION!!!

HELP!!! I have so many video games, I cannot seem to sleep
at night. Please buy them now and save me from permanent I
NSOMNIA!!!

This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

Remember to bid high and bid fast because if you donUt, you
may miss your opportunity to own the games you really want.
And above all, remember to have fun!!!

The rules to this auction are at the end of this message.

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Air-Sea-Battle, box is damaged $2.00 min

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $3.00 min

-Space War $3.00 ltravis

Atari 2600-LOOSE GAMES

-Adventure $2.00 mnathan

-Armor Ambush

-Basic Math: Atari, cx-2661

-Bowling: Atari

-Boxing: Activision $1.00 lestermi

-Canyon Bomber: cx-2607 $1.00 ltravis

-Circus Atari: Atari $1.00 ltravis

-Chopper Command $1.00 mnathan

-Codebreaker

-Crystal Castles: Atari $4.50 chrine

-Defender: Atari

-Demon Attack

-Enduro: Activision

-Flag Capture: Atari cx-2644

-Freeway: Activision $1.00 mnathan

-Ghostbusters: Activision $3.00 ltravis

-Golf: cx-2634

-Gorf: CBS Video Games $1.00 ltravis

-Hangman: Atari

-Human Cannonball: Atari

-Ice Hockey: Activision $1.00 ltravis

-Joust: Atari $1.00 lestermi

-Kool-Aid Man: General Foods Corp. $5.00 ltravis

-Marine Wars: Konami $7.50 cbrem

-Millipede: Atari $1.00 lestermi

-Night Driver: Atari

-Outlaw: cx-2605

-Popeye: Parker Brothers $1.00 lestermi

-Pitfall: Activision

-Q*bert: Parker Brothers $1.00 lestermi

-Raiders of the Lost Ark: Atari $1.00 mnathan

-Reactor: Parker Brothers

-River Raid: Activision $1.00 mnathan

-Space Jockey: US Games

-Star Master: Activision

-Star Raiders: Atari

-Star Wars The Empire Strikes Back $1.00 mnathan

-Strategic Space Combat Game: Sears Telegames $1.00 lestermi

-Street Racer: Atari

-Super Challenge Baseball

-Superman: cx-2631 $1.50 mnathan

-Target Fun: Sears Telegames

-3-D Tic-Tac-Toe: cx-2618 $1.00 ltravis

-Venture: Coleco $1.00 ltravis

-Video Pinball: Atari
Damaged Label

-Yars Revenge: Atari

ATARI 5200-LOOSE GAMES

-Centipede, w/ overlay $1.50 min

-Counter Measure, w/ overlay, w/ directions $2.00 min

-Defender, w/ overlay $2.00 min

-Football, w/ overlay $1.50 min

-Galaxian, w/ overlay $1.50 min

-Gorf, w/ overlay, w/ directions $2.00 min

-Jungle Hunt, w/ directions $1.50 min

-Kangaroo $1.50 min

-Mario Brothers, w/ directions

-Pac-Man, w/ overlay, w/ directions $1.50 min

-Pole Position, w/ directions $1.50 min

-Popeye, w/ directions $1.50 min

-Real Sports Soccer, w/ directions

-Star Raiders, w/ overlay, w/ directions $1.50 min

-Super Breakout, w/ overlay $1.50 min

ATARI 7800-LOOSE GAMES

-One-On-One $2.00 rdubinsk

-Pole Position II

COLECOVISION-LOOSE GAMES

-Carnival

-Donkey Kong

-Donkey Kong Junior

-Gorf

-Ladybug

-Mouse Trap

-Rocky Super Action Boxing, may not work, case is damageed

-Smurf Rescue in GargamelUs Castle

ATARI 400/800-LOOSE GAMES

-Atariwriter Word Processor: RX8036 $1.00 rwjones

-Basic Computing Language: CXL4002

-Pac-Man: CXL 4022 $2.00 mnathan

-Space Invaders: CXL4008 $3.00 mnathan

-Star Raiders: CXL4011

INTELLIVISION-LOOSE GAMES

-Advanced Dungeons &Dragons

-Armor Battle

-B-17 Bomber

-Burger Time $1.00 ltravis

-Carnival: Coleco

-Commando $5.00 rdubinsk

-Donkey Kong: Coleco

-Electric Company, label is damaged

-Frog Bog

-NASL Soccer $2.00 rdubinsk

-Pitfall: Activision $1.00 ltravis

-Space Hawk

-Space Spartans

-TRON Deadly Discs

-TRON Maze-A-Tron

-Utopia

INTELLIVISION-Box+Directions

-Armor Battle $2.00 min

-SNAFU, box, no directions

-Sub Hunt, shrink wrapped: $3.00 min

ODYSSEY2-loose games

-Alien Invaders-Plus, w/ box, w/ directions

-Alpine Skiing

-Blockout/Breakdown

-Computer Intro

-Hockey/Soccer

-Invaders From Hyperspace

-Ive Got Your Number

-K.C. Munchkin

-Math-A-Magic/Echo

-Speedway/Spinout/Cryptologic, w/ box, w/ directions

-Sub Chase/Armored Encounter

-UFO

SEGA MASTER SYSTEM

-Hang On/Safari Hunt

COMMODORE 64-Loose Cartridges

-Jupiter Lander

-Sea Wolf

TEXAS INSTRUMENTS 99/4A-Loose Cartridges

-Addition

-Addition and Subtraction 1

-Adventure

-Alien Addition

-Alligator Mix

-Alpiner

-Beginning Grammar

-Blackjack and Poker

-Car Wars, w/box, w/ directions $4.00 min

-Computer Math Games II

-Connect Four

-Division 1

-Dragon Mix $5.00 min

-Early Reading $1.50 min

-Early Learning Fun w/ directions

-Hangman

-Home Financial Decisions

-Household Budget Management $1.50 min

-Hunt The Wumpus

-Meteor Multiplication

-Moon Mine

-Multiplication 1

-Munchman

-Music Maker

-Number Magic

-Parsec $1.50 min

-Pac-Man: Atari $2.00 riffraff

-Percents

-Personal Record Keeping

-Personal Report Generator

-Scholastic Spelling Level 3

-Story Machine

-Super Demon Attack $2.00 aa441

-Terminal Emulator II w/box, directions $4.00 min

-The Attack

-Touch Typing Tutor

-Tunnels of Doom

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for
them, but I will not guarantee that I find them. Shipping
will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari Ultra Pong Doubles $4.00 min

-Atari 2600 jr, no cables does work $4.00 min

-Atari 2600 jr, no cables does not work $2.00 min

-Atari 2600 Paddle Controllers $1.00 min

-Atari 800XL, no cables $8.00 min

-Atari 1200XL no cables $8.00 min

-Atari 1050 Disk Drive, no cables $8.00 min

-Colecovision, w power supply, joysticks $10.00 paladin

-Commodore 64 Computer, w/ power supply, in box $10.00 min

-Commodore 1541 Disk Drive, w/ cables $10.00 min

-Intellivoice for Intellivision Systems $6.00 min

-Odyssey2 in box with cables not working $1.00 min

-Texas Instruments 99/4A box + cables $10.00 min

-Texas Instruments 99/4A Speech Synthesizer $6.00 min

ATARI 2600-excess

-Pac-Man
-Combat
-Asteroids
-Defender
-Missle Command
-Space Invaders
-E.T

Send all bids to: jrm8248@u.cc.utah.edu

HERE ARE THE RULES:

1. This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be INSOMNIAC BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $3.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signnifies your consent
to follow these rules as stated.

1756. Re: Why a new OS? My thoughts, existing compilers and the Sweet-16...

Newsgroup: comp.sys.atari.8bit

From: krishna@primenet.com
Message-ID: <3vmv69$ksc@nnrp2.primenet.com>
Source record: 89478

Mike at FTE has obviously been busy, but certainly with any hardware project you could use an update to the languages so you can WRITE something for it. (Regarding Sweet16). MAE is okay for the assembly programmer but what of others? One of the reasons the T-816 failed is that it had nothing other than an assembler available for it.

FTE has the source (I presume) to the OSS/ICD languages so it's up to him whether he wants to update them. I think BXE and Action! are fine candiates for 816 usage. Certainly both languages could use some updating to take better advantage of banked RAM (BXE for more banks, and Action! for better memory handling in general) but it's been so long since FTE took over that I don't think it's gonna happen because it hasn't in all this time.

Another thing they could make easier is MODULARITY. Being able to load up another program, store parameters someplace, and run the new program, would be important for 64K machines. Carina really jumps through hoops to accomplish this. Memlo and other memory handling/Basic registers, USR calls, etc...

And of course, any language for the 816 should be able to expand its symbol table as much as you have room for. I believe BXE reserves most of the rest of main RAM for this, but this might be a bottleneck on a multimeg machine.

1759. Update on "Unofficial Atari 8-bit New User, Emulator Help FAQ"

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-02 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <3vn270$rbu@nic-nac.CSU.net>
Source record: 89481
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

My FAQ, the "Unofficial Atari 8-bit New User, Emulator Help FAQ", which
has helped many:

(1) Use PC Xformer, the Atari 8-bit emulator for PCs
(2) Start or get back into using the Atari 8-bit computer (emulated or not)

Has now, FINALLY, been changed from raw, preformatted text into (currently
somewhat buggy) HTML!

ALSO, very soon, additions such as:

More information on the later versions of PC Xformer, including the
upcoming 4.0 release!
Information on using Rainbow, the Atari 8-bit emulator for Macs..
& Information on using "6502", the 6502 CPU and Atari 8-bit emulator for
Unix!

Help is needed of course - please ask questions, report mistakes and
errors and whatnot to me as soon as you find them!

Both the older 0.7 (text only) version ("xf2faq.txt"), and the newer,
still-needing-its-filename-changed 0.8 (HTML) version ("xf2faq.html")
are still available from my Home Page, at this URL:

http://zippy.sonoma.edu/~kendrick - my page
http://zippy.sonoma.edu/~kendrick/nbs - New Breed Software's (also me)

Thank you very much!

For those interested, yes, the document will still be posted irregularly
to both comp.sys.atari.8bit and comp.emulators.misc, once it has been
churned through an HTML to text converter (probably just dumping it out
through Lynx for Unix).

The whole FAQ is still one linear document, by the way (for now at least)

Thanx again!!!

-bill!

Robert Rumpf (rumpf.1@osu.edu) wrote:
: Okay, I just got an 850 interface, and I'm trying to log in to a local
: freenet - but IceT (which I've never used before) tells me there's no
: modem handler installed. I read the readme for IceT and it says I should
: have gotten a handler file with the 850 (I didn't - Frank, do you know
: anything about this?). Bobterm loads some sort of handler directly from
: the 850. So what do I do to get IceT to work? Or is there a better comm
: package that suppports vt100 that I'm not aware of???

No, Ice-T works fairly well. The problem is that Ice-T doesn't use the
built-in handler in the 850. I tried several handler files and ran
across one ftp-ing to UMICH. It's a 16-sector (single-density) file
named ATARISRS.232 and must be 'pre-appended' to the Ice-T file or put it
a batch file before loading Ice-T.

Hope this helps.

1761. Re: "Hello World!"....

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-02 00:00:00 UTC
From: snyder10@rs1.tcs.tulane.edu
Message-ID: <3vn510$ibk@rs10.tcs.tulane.edu>
Source record: 89483

Saw the post talking about the "Hello World!" bit...I got the idea (maybe wrongly) that the author thought doing the same thing in ML was harder just because of a few extra line.

If I was doing the "Hello World!" bit under SDX I'd cheat...(see example)

```
;SDX Hello World!
.OU D6:>HELLO.COM
;
PRINTF = $A926
.OR $3000
;
PRINT JSR PRINTF ; SDX lib function
.BY $9B
.BY "SpartaDOS X Hello World!"
.BY $9B "Version %b.%b" $9B
.BY $9B $00
.WO FIRST
.WO SECON
FIRST .BY $01
SECON .BY $01
RTS
;
.OR $02E0
.WO PRINT
.EN
```

Or I could cheat this way under either MYDOS or AtariDOS 2.x...(see example)

```
;Atari / MYDOS Hello World!
.OU D6:>HELLO1.COM
;
ICCOM = $0342
ICBLL = $0348
ICBLH = $0349
CIOV = $E456
;
.OR $3000
;
PRINT LDX #$00
LOOP TXA
PHA
LDA TEXT,X
LDX #$0B ; PUT BYTE
```

```
STX ICCOM
LDX #$00
STX ICBLL
STX ICBLH
JSR CIOV
;
PLA
TAX
INX
CPX #$1E
BNE LOOP
;
END RTS
;
TEXT .BY $9B "DOS Hello World!" $9B
.BY "Version 1.1" $9B
;
.OR $02E0
.WO PRINT
.EN
```

Yeah, I know it's a bit boring but hey...I'd nothing better to do this evening than chip in my 2 cents! Anyway, while CC65 and Action! are nice, and yes, Action! does produce ML not Pcode, nothing beats ML.

Mike

Actually I solved the problem last night shortly after posting. I found a
file called auto850.arc at the merit archives, which turned out to be a
basic program which, when run, creates an autorun.sys file which boots the
850 as an R: device. I didn't pre-append this to Ice-T (I don't like the
idea of doing that; don't ask me why) but running this file (which I
renamed 850boot) and then running IceT worked just fine!

From: markg@alpha.wcoil.com
Message-ID: <3vo61h$hl0@ns.concourse.com>
Source record: 89486

About 6-7 years ago I was asked to redesign and build an
Automation System for our radio station here in Lima, Ohio... This system
would have to join our ABC Network at the top of each hour, play
commericals at each stop break, control 4 other cartridge machines, and
play a Music Format using 4 reel to reel tape decks.

Wow, this seemed impossible ...

At the time, I owned an Atari 130XE computer and was doing alot
of BASIC programming, and decided to use this machine as the "brains" of
the operation. With the help of the BASIC XE and RTIME modules I was
ready to write the program.

To make a long story short, the Atari 130XE is still in operation
and running our 1000 watt Radio Station from 9PM-5AM every day of the
week, bringing in and controlling shows like; Mike Reagan , Lowell Ponte
and many others...

Mark Gierhart
WIMA Radio

P.S. Don't have the date in front of me, but ANTIC magazine published an
article about this system..

```

Glenn, just some mildly relevant stuff on the language/816. I don't see myself upgrading anytime in the near future, but implementing the kludge of the 816 in Action! would be trivial. I've already posted how to write a subroutine in assembly to be called as an Action! PROCEDURE(). To take advantage of something like a 816 all that would be necessar is to write the PROC in 816 code. For instance, the MoveBlock() routine could be rewritten in 816 and if my memory of John Harris post is correct, it would only be 2/3rds the size & about 2 times as fast. Ditto for several other PROCs like Zero(), I think the 816 has a STZ command that would really make things like clearing the screen fly.
But I really doubt if Mike has a heck of a lot of stuff more then ROM images for the CARTs. I'm under the impression that except for the BASICs and maybe DOS XL a lot of code was licenced from outside developers so the quality of the source code or if it ever even got from developer to OSS to ICD to FTE in a usable form is questionable. But as John pointed out, most of the routines in 816 are considerably shorter then the equvalent 6502 code. Doing a disassembly of the code & patching it is possible but gawd awful painful.
BTW: All the different PROCs for printing bytes, cards, ... that someone mentioned? Done for one reason, speed. You could have a smart print routine that figures out what you're trying to print like BASIC, but it's a lot of overhead when you just want to echo something to the screen. This is one of the reasons basic starts flaking out badly above 300 baud while it's hard to write an Action! program that won't do at least 2400.

Hello ,

In a message of 31 Jul 95 Mr. wrote to All:

>> What can I do? Would sending a picture of my xe be necessary for me to
>> get ROM images?

MT> I have the same problem. 800 and 800XL, no 850, and no way to get what
MT> I need from my Atari to my Mac.

What kind of ROM images do you both need, normaal ROM DUMPS?
And if so with one do you like the most maybe I can look for you both?

1768. Atari 800XL w/850

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-02 00:00:00 UTC
From: tone@unix.trilogy.net
Message-ID: <3voc1a$leu@unix.trilogy.net>
Source record: 89490

I have an Atari 800XL, an 850 expansion box, and a 1050 drive...
I was wondering what useful things I can do with this, I have no disks or cartridges for it, but I know it works...
Could I connect an external 2400 modem to it? I have an IBM compatible external.
Also, what difference is there between the power supply for the 1050 and the 850?
Any help would be greatly appreciated.

Anthony

k >bytes? <:^[

Didn't you yourself say a couple a month ago, that you had read in Mapping...
that the Atari can use sectors up to 65536 bytes big?!? If software can't
do this, hardware should....

k >Although - some less optimistic software FORCES you to access "D:" for file
k >I/O, so perhaps an addition to DOS which takes, say, D7: and accesses the CD
k >through it.. (then again, some REALLY pessimistic ;) software FORCES you
k >to use "D1:"! ARGH!!!)

Hmm, so you don't have a BlackBox or USplus OS????

w >your particular tastes....

Nope, I haven't. Will all of the above run on a classic Atari?
Can it use 1.44 meg floppies?
Which DOS is needed?
Do I need to understand C?
Can it use extended memory on the 8bit?
Are their any limitations?
I'm not much of a programmer....

t >Date: 19 Jul 1995 01:54:59 GMT
t >
t >Anybody willing to sell me their 800XE, repeat, 800 XE or know where you
t >can get one?

Howdy Tom

They were sold in Germany. Since Atari Benelux closed it's doors recently,
800XE's are now sold at "InterToys" (a toystore, as you might have guessed).

All 800XE's are PAL machines.
Use two 64 x 4 memory chips.
Have room for two more of those 64 x 4 chips (you'd also need a chip called
PAL (not the TV standard) for the bankswitching stuff (that's what I've been
told))
Furmer (sp?) keyboard
Faster selftest, that'll go up to 128kByte if it can find that much.
PBI and ECI interface

Message-ID: <3vr7pk$6be@link.xs4all.nl>
Source record: 89361

k >From: kendrick@zippy.sonoma.edu (William Kendrick)
k >Subject: Re: Describe your Atari setup!
k >Date: 22 Jul 1995 04:33:53 GMT
k >
k >James King called one of his computers "576K XE"
k >
k >I think the Atari name for that would be something like the "580 XE" :)

Well, the 64kB XE was called 65XE
the 128kB XE " " 130XE
so I guess the 576kB would be called 585XE (9 times 65)

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

Wouldn't it be nice, if you could even glue the numbers on the case, so it looked like it really came from the factory that way? But where would you find a number _8_?

A yes, from an 800 XE.

Are the _ST_ numbers physically the same as the numbers used on the classic Atari's. We'd have 1, 2, 3, 4, 5, 6, 8 and 0 to work with. Maybe if you turned a _6_ around, it could be used as a _9_.

1775. Re: Modifying Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-03 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <3vr7pk$6bg@link.xs4all.nl>
Source record: 89362

Howdy folks

Here's what I think about some of the upgrades. I'm not a power user.
I wrote TWO whole programs in all the time I have the XE(s). Bought my
130XE when they were just released. O yes, these files were written in BASIC.
I use my XE(s) for word processing, game playing and communications.

I want: (but may not be able to afford)

- 80 columns video. Most BBS's use 80 colums. And it makes reading text much
easier. And you wouldn't have to scroll over the text in PabQWK.

- If you're adding an extra 40 columns, why not ad lots of colors. So we can
view GIF's in full detail and color (yes, I'm a pervert) without dozens
of classic Atari programmers getting headaches trying to find ways to
get the human eye to see more colors then there really are. And use
users getting headaches from looking at the srceen flicker :-)

- More memory. When visiting a BBS I use the capture buffer. Guess what,
with all that netting going on (which I REALLY like), there is so much
mail, that the resulting textfiles are HUGE. Sometimes I want to keep
a certain message, because of the information in it. Very often, the
message is in the part of the file, that just didn't fit inside the
wordprocessor.

- More speed. I read THREE groups here. Even cut in smaller portions, every
file is still 350,000 bytes long. When ARCed. UnARCing takes AGES.

With all of the above, even FAX software would be possible.

But I don't want to lose the 8 bit feel. The classic Atari is difficult enough
to master.

And, I don't have to money to move to an other system. Heck, with the above
upgrades, we could manage till halve way thrue the next century. If you
buy an IBM today, it will be to slow and to "small" the day after. MAC's are
even more expensive, but nicer. Will they make it? And the rest is just about
as "alive" as the 8 bit Atari. So why move.

CU Mathy Van Nisselroy mathniss@link.xs4all.nl

<now I told them what's on my wishlist, I can start collecting X-rated GIF's>

:-)

I have the following computer books
for sale, most are for the Atari
8-Bit line of computers.

Title; Author; Publisher; Description;
Price

6502 Assembly Language Subroutines;
Lance A. Leventhal & Winthrop
Saville; Osborne/McGraw Hill; Source
& Reference for Assembly Language
Routines;.....$5.00 U.S.

Advanced ATARI BASIC Tutorial; Robert
A. Peck; Computer Direct;...$7.50 U.S.

Advanced Programming Techniques for
your Atari. Including Graphics & Voice
Programs; Linda M. Schreiber; TAB
Books; Comes with 55 Type in Programs.
.....$5.00 U.S.

An Invitation to Programming 2:;
Atari; SoftWare Manual for Writing
Programs;.....$5.00 U.S.

Atari 400/800 DiskGuide; John Taylor &
David A. Wilson; Osborne/McGraw-Hill;
.....$5.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Referen/Minus front Cover;
.....$3.00 U.S.

Atari Basic; Bob Albrecht, LeRoy
Finkel & Jerald R. Brown; John Wiley &
Son.; Basic Reference;.....$5.00 U.S.

Atari Basic Reference Guide; Atari;
Quick Reference for Atari Basic.;
.....$7.50 U.S.

Atari Graphics and Arcade Game Design;
Jeffrey Stanton with Dan Pinal; Arrays
Inc.;.....$7.50 U.S.

Atari Microsoft Basic Instruction Manual; Atari; PhotoCopied and Bound Manual;.....$5.00 U.S.

Atari Sound and Graphics; Herb Moore, Judy Lower, Bob Albrecht; Self Teaching Guide;.....$5.00 U.S.

Atari User's Guide; Mark Ellis, Robert Ellis & Larry Joel Goldstein; Brady Communicat Basic & Graphics for Atari 400/800/600XL/800XL/1200XL;$10.00 U.S.

Basic Atari Basic; James S. Coan & Richard Kushner; Hayden Book Comp Atari Basic Book for the 400, 800 and the XL Computers;.....$5.00 U.S.

Beyond Games. Systems SoftWare for your 6502 Personal Computer; Ken Skier; Byte Publishing;.....$7.50 U.S.

Bits, Bytes and Buzzwords; Mark Garetz; dilithium Press; Understanding Small Business Computers;...$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GAMES; COMPUTE! Books; Type in Game Listings with info on Developing your own Games!;.....$5.00 U.S.

COMPUTE!'S FIRST BOOK OF ATARI GRAPHICS; COMPUTE! Books; Games, Tutorials, Programs & Other Helpful Information!;.....$7.50 U.S.

1783. New 8bit OS

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-03 00:00:00 UTC
From: chair@pgh.nauticom.net
Message-ID: <DCq0Mx.L9o@pgh.nauticom.net>
Source record: 89370

Subject: New 8bit OS
Newsgroups: comp.sys.atari.8bit
Organization: Nauticom - Internet Access Provider
Summary:
Keywords:

I've been reading about the proposed idea for a new graphical os for the 8-bits. I remarked once before that 'its too bad no one thought of this 10 years ago.' Then, as i was reading some of the postings, i remembered reading about just such a thing. Digging through my bookshelf, i found what i remembered. On page 72 of the July/August 1989 issue (not quite 10 years) of Atari Explorer, David Noyes reviewed 'Diamond GOS.' According to the article, Diamond GOS, made by Reeve Software, was a piggyback cartrige into which other cartriges could be connected. One of these cartriges was the Diamond GOS programmers module, which came with the package. Also in the package were two disks, one with Diamond Paint, and the other was a utility disk. The users and programmers manuals were also included. The OS provided a GEM (ST) like interface and icons. As far as disk access, it was compatible with Atari DOS 2.x, Sparta DOS, and DOS XE. For a pointing device, you used an ST mouse, a joystick, koala pad, or track ball. Diamond GOS specific applications were available, and i believe that it also ran existing software (but i'm not sure).

Take a look around, and you'll see that Diamond GOS did not succede as a new 8-bit os. Will the new one?

And now for my support of the new os: The failure of Diamond GOS could have been partially due to its $80 price tag, and its late release (1989 as opposed to 1983, which would have been better), (although 1995 doesnt exactly qualify as better either). If you do make a new 8-bit os, i say William Kendrick has the best idea: have a library of routines at a fixed address, which programs could call, instead of having to redefine a window every time. And make this library available to all existing languages, instead of just the os's own language (i think that was someone elses idea tho, not sure who). MS Windows for pc's works kind of like this, but each compiler must have extensions for the Windows routines (not as efficient as including only the sub's address in the prog, but a similar idea). Bill DEFINITELY had the right idea in saying have a different but 100% compatible version of the os available for every level of upgraded (or non upgraded) system.
To assure the success of this new os, it would have to support the old software (even if you have to move cartriges to disk images); and be FREELY AVAILABLE. Make it either public domain or shareware with a fairly cheap registration cost (no more than US$25, as some people's reason for using the Atari 8-bits is because they cant come close to

affording a new pc, but that's not to say i wouldn't use the Atari8 if i did have that kind of money; i like my Atari, it was my first computer and i dont want do give it up.. ever). (Dont you just love these run on sentences in parentesis which are attached to run on sentences :))
Getting back to the 'freely available': make sure all versions are uploaded to all of the atari8 archive sites, or at least UMich and all of its mirrors. Also: BE ABSOLUTELY CERTAIN to include a command line interface (cli), even a SpartaDOS shell would be good. I'd take an Atari 400 w/ 16k ram and a single tape drive and a b/w television for a monitor over a top of the line power macintosh any day. (Partially because i like the Atari, and partially because i dont like macintosh (no cli).)

I don't mean to rant, but hey, it happens. If this new OS will run on my 64k 800xl and has a cli i'll get it (maybe i will even without a cli, just because its Atari). No flames please, insane minds work in weird ways (i know mine does).

As far as my Xformer emulators go, I got permission from Atari back in
1987 to include their OS images in my emulators. You're notice all
versions of Xformer carry Atari's copyright notice and a "used with
permission" notice.

As far as Rainbow and STonX and all these other Atari emulators that
aren't obtaining any sort of permission, well, they're on their own.

1787. 1010 Tape Drive WANTED:

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-03 00:00:00 UTC
From: etlprcr@etlxdmx.ericsson.se
Message-ID: <3vqi0l$kho@erinews.ericsson.se>
Source record: 89494

A while ago, someone borrowed my 1010 tape drive and promptly lost the thing. I have a lot of software on tape and would like a replacement for it. Does anybody (UK / Europe) have one they would like to sell me? I believe there are other types of tape drive so, I may consider an alternative, as long as it works with a standard 800XL.

A damaged drive may be of use, but depends what is wrong with it...

Reply by E-mail please!!

Thanks, Zargwog...

1788. US+ OS

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-03 00:00:00 UTC
From: jeking@xmission.com
Message-ID: <3vqjf6$bjl@news.xmission.com>
Source record: 89495

How many of you folks have Bob Puff's US+ OS upgrade installed in one of your machines? Do you like it? Do you find it a valuable asset to your 8bit computing?

I just bought one, and havent had any luck installing it in my upgraded XE so far.. works great in my stock XL, but since theres no ramdisk in that machine, I cant try out or take advantage of the built in ramdisk handler(s).

1789. Re: MAC Atari 8bit emulator

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-03 00:00:00 UTC
From: lamcw@aston.ac.uk
Message-ID: <DCqozz.37G@aston.ac.uk>
Source record: 89496

; Now the question is how to get all the old games from my Atari 800 over
;to my Mac. Any suggestions?

Have you read the 'Appendices' file? My solution is to use the 850 unit.
This is fine for small files using the XFER program included.

For disk images, I envisage a solution using DISCOMM3 (public domain)
which compresses an image into a DOS file. Then if you're a dab hand with
a soldering iron, wire up a FULL RS232 cable to the Mac. I'm not
too sure about the exact details. Then use BOBTERM to transfer files
over which it should do speedily.

Good luck,

Chris.

1790. Re: SIO2PC cable as RVerter - how!?

>I heard chit-chat of SIO2PC cables being used as cheap RS232 interfaces.

I've attempted it, but haven't had time to make even the sio2pc part
work right, let alone the rest.

>I loaded it with the standard RVerter R: handler (like for SX212's).

That should be right.

>Does it depend on the cable - was I using a wrong handler - did I have
>some FT80 options messed up for that config?

Which version of the cable are you using? The 2-chip version requires
some modification, or a switch; the 1-chip version may not require
any changes, but I haven't been able to confirm that yet.

I am trying to avoid a ROM-based system; there are three BIG
problems with them:

1) expensive initially
2) pain to debug
3) expensive to upgrade.

Why use lynx for this? Yes, it's the most obvious answer, but if your
program is asking for the file anyway, it might as well use http and
go get the page itself. (maybe telnet directly to the http port.)

There are also small perl scripts to get documents from the web. I
don't know how the perl overhead would compare to the lynx overhead.

Send all bids to: jrm8248@u.cc.utah.edu

HERE ARE THE RULES:

1. This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be INSOMNIAC BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $3.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signnifies your consent
to follow these rules as stated.

Define "useful" in terms of what is useful to you. The folks who hang out here have found plenty of useful things to do with these old things. We still play games, run shell sessions through an ISP, and a lof of the people are still developing new software.

: Could I connect an external 2400 modem to it? I have an IBM compatible
: external.

Should work fine. You'll need to acquire communications software. The c.s.a.8 FAQ lists several alternatives. You may need to find a kind soul to mail you a copy of the software, unless you're lucky enough to have a place nearby where you can get it.

Can anybody update me on a few items? I have been out of the Atari 8-bit mainstream for a number of years, only recently getting 'plugged in' again. I would like to know what the following items are, and what they do. I have gathered that they will be produced by FTe, the buyer of the ICD, etc. stuff for the 8-bit.

1.)MIO II.
2.)Mars 8.
3.)Sweet-16. I am especially interested in what this is, due to the fact that 'Sweet-16' was the code name Atari Corp. gave to the 1450XLD!

Thanks in advance!!

1799. IDE Drive

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-04 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9508032137591.The_Win-D.bjcorr@delphi.com>
Source record: 89371

Well, I finally got Bob's IDE interface up and working! The board itself is about 2" x 4" and mounts piggy back on the CPU socket, the CPU mounts on the board. besides the CPU there are only 2 more chips and the IDE ribbon cable connector. Right now I am using a Toshiba 2.5" drive (MK1122FC) and it will be permanently mounted inside my 1200XL. At the moment it is getting power from an old PC switching PS (the board gets it's power from the 1200), but I have already done the mod to my other 1200 to run the whole rig off of 1 beefy switching PS. (With the 2.5" drives you can use a +5v only PS, for the 3.5" drives you need the usual +12v/+5v supply.) Ripping out the heat sink, etc. just left more room for the drive and the PS has enough amps for more goodies (Bob has a 130XE compatable memory upgrade that is due next.)

The drive works with MyDos and 2.0s for sure, probably all 2.0s clones and very likly the latest SDX upgrade. The software as written cuts the drive up into 1 meg segments that are banked in and out with a keystroke, but this can be easily modified to any segment size needed. Yes, it is fast!. Now the problemns.

The code to run the drive requires;
1) A slight modification to the OS to tell the OS to JSR to the IDE code if the drive selected is drive 2 (the IDE drive number, this too can be changed.) Only 3 bytes at $9C5B, but still in the OS area. At the moment I am running the OS out of ram to do this. But there are other options..... 2) A safe place to hold the nearly 256 bytes of code that run the drive. Right now I am using page 6, not too safe as is well known. One solution is a little hardware hack (by Bob), to place the $D600-$D7FF area into RAM and put it there (again in the OS area.) Hmmmm..... And you lose half the drive capacity due to the 8-bits 8 byte data bus.

The best solutions are to;
1) Burn a new rom. The modifications required should not pose any threat to exsisting software (I could be full of it here, especially in regards to the 3 bytes at $9C5B! Anyone?) 2) Bob's soultion is to install a smart socket and put the OS in there. Locking the smart socket after reading in the OS and any mods should make it not only safe, but easily user alterable should you so desire.

Right now I have to run the drive with the Assembler/Editor Cart in , so I can load and assemble the IDE code and the ROM to RAM os switcher (I have made the ROM to RAM program a binary I can load from DOS but it will NOT function as an autorun.sys, I have no idea why. The other IDE code has to be assembled in 3 locations and I don't yet know how to get THAT into a binary file. HELP!!!!) The total cost of the project is less than $10, probably less than $5, but needs careful attention (I blew it many times, I speak from experience). I got the drive for $20 used (43 meg, 21.5 meg usable although

right now I am seeing 16 1 meg segments. Hmmm...)

I did have problemns with my first drive, Kalock KL 3120. Don't know why. Nearest I can guess at, the interface floats the IOR and IOW lines at boot up, but the voltage was high enough to fool the Kalock into thinking that the lines were high, and it has a seizure. Weird.

Oh well, that's it so far. When the smart socket get's done I'll let you all know. Anybody want to burn a ROM or two for me????

1800. Atari 800 Moonpatrol

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-04 00:00:00 UTC
From: sw@machete.wh.att.com
Message-ID: <DCt2n8.1F4@nntpa.cb.att.com>
Source record: 89372
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

Hi,
I'm having a curious problem with the 800 Moonpatrol cartridge.
Player one continuously jumps as if the joystick was being pressed up. The
joystick works fine with other cartridges though. Player 2 work correctly.
I would think it was a cartridge error, but it seems to be pretty specific.
If anyone has seen this or could offer some help please reply.

Thanks

Scott.

You didn't tell us what machine you're plugging it into. You wouldn't
happen to be using a 1200XL, would you?

1802. Mydos and autorun.sys

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-04 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9508040144591.The_Win-D.bjcorr@delphi.com>
Source record: 89374

Gentelmen I have a problemn.

I have a small autorun.sys that copies my os from ROM to RAM then enables the RAM os. Works fine under 2.0s, but won't work under Mydos 4.53. I looked at the file sectors, normal FF FF header with the start and end address's after the FF. Normal run address load vector into E) and E! at the end. Does Mydos use a different name for it's autorun.sys file? I couldn't find one in the manual. Anyone?

1805. ColorView idea...

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-04 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <199508041817.LAA10088@zippy.sonoma.edu>
Source record: 89377

Would it be all that hard to make a ColorView screen sit in banked memory? I mean, all you'd need to do is, along with changing the color registers, is change the bank registers.

The image data, PLUS another image (say it's for a paint program and you add an "undo" feature) could be stored in 48K worth of space, still leaving 16K free for folks using 130XE's and 176K free (almost 8 >uncompressed< images!) for folks with 256K total (like me).

This way, main RAM will only lose 16K (where the bank is) and not 24K (or more, depending on the CV routine. One I got ahold of forces a person to sit each part of the image exactly on $x100. Makes the CV routine easy to program, but eats a lot of memory, esp. in an environment like Action! (or is it just me? :)))

Here's a diagram :) ...

```
Red1 \ 1st 16K block \
Green1 / > Actual image
Blue1 \ 2nd 16K block /
Red2 / \
Green2 \ 3rd 16K block > "Undo" buffer
Blue2 / /
```

Actually, when you think about it, it might be more advantageous (since you're dealing with ~24K worth of data to move around EVERY TIME YOU DO SOMETHING!) to make an intelligent undo. Graphic Converter for the Mac does, and I'm sure other programs do as well.

Some examples:

Only record the section of image a routine is being done to (say you placed a filled square or filled circle or a line on the image. Only record the area which it encompasses)

Record points (when drawing, Graphic Converter seems to have a buffer which records: X,Y,old-color as you draw. So when you undo, instead of redrawing a block of the screen, it simply goes through that buffer and "fixes" everything)

Now... the good part. This has little to do with the above "neat ways" to save memory and time, but with some cool things one could incorporate into such a ColorView paint program (since it's CV, we have an excuse to use more nifty drawing algorythms!).

Like Autodesk's Animator for MSDOS, this program could have three specific selections a user makes when drawing.. not just "color" and "shape", but

instead, "effect", "shape" and (a sometimes ignored) "color".

Effects could include: Soften, Brighten, Dither, Smooth <- some colorless fx
Opaque, Tint <-- some colored fx

And of course, these routines would be modules. If you wanted the "Soften"
routine, but happened to have the "Dither" routine in memory, the program
would load "Soften" in where "Dither" was. (ie, most routines would take
up a bit of memory, so why not make them ALL modules which all sit in the
same area).

Now, for shapes (before I get into how both are incorporated together)..

Square, Circle, Ellipse, Polygon, Line, Ray, K-Line, Point, Brush, etc.

When I select "Square", it loads up if necessary.
Then I select "Tint".. it loads up if necessary.
Then I select a blue color.

I go to draw.. The "square" routine takes over. When I'm done drawing,
it creates a map saying "These are all of the points which I am taking up".

It then sends this list (map) to the "Tint" routine..

Tint then simply goes through each point and does it's job (tints each
pixel with some "blue"), and tada... we're done!

Oooh.. now that I think of it, perhaps adding some routines to let you
turn off CV mode (it will of course turn of automatically when work is
going on like loading, saving, drawing routines (tint, for example), etc.).

Perhaps it could let you switch between CV, Red, Green and Blue images..
Then you could edit ONLY certain colors of the image... Hmm... it might
be useful.

So.. does this idea sound pretty cool or what!? :) :)

;Okay, so would there be any interest in a program, or a commercial (say,
;$5 a disk) service for converting Atari floppies to emulator-compatible
;"disk image" files?

There's nothing special about disk images for emulators (not for Atari 8bit ones anyway). You just need a carbon copy of the original disk, as long as there's no disk protection on the "original". DISCOMM3 is a great utility to compress whole disks into much smaller DOS files. These can then be uploaded to any computer you want.

As for a commercial service, I'm sure someone out there with the summer off can provide one. Might even be quite lucrative...

Hi,

Some typing errors have been spotted in the APPENDICES file.

The mistake is in the XFER program given to transfer files from
the Atari to the Mac.

This has been corrected and the demo at InfoMac will soon have the
new version.

You can also get a copy of the new text from

http://www.aston.ac.uk/~lamcw/emulators.html

which Rainbow users should browse occasionally for news. Also from
this site, you can download a freeware utility called HEXEDIT which
is very handy for editing disk images and other files.

You can also email me for the new text if you wish.

Apologies for error.

If you mean sticking Atari floppies into the IBM, yes and no. I'm no expert in this case, sorry.

If you mean access files from your Atari, yes, a few ways:
(1) SIO2PC (by far the coolest way to do it) - It makes your PC emulate up to 4 Atari disk drives of any size (up to 16MB)
(2) Terminals (using two modems or a null-modem cable)

Both of these of course require that you HAVE an Atari 8-bit.

#1 needs an SIO2PC cable and a disk drive (so you can get the files from the disks onto the PC) (after you're done, you no longer need to use your disk drives) (note: copying copy-protected software is of course impossible since it's just like copying from one disk to another)

#2 needs a modem interface on the Atari and either two modems or a null-modem cable, as well as a terminal program on both computers

Good luck!

Source record: 89385

Nosync - thanks for the kind remarks. :)

Yes, again, to sum up what you said, and what I've said in the past through-out
my posts: (this IS important!)

Graphical Windowing Interface
Textual Windowing Interface (for speed and for graphics-less programs)
Modules (upgrade the window routine, leave the rest the same, for example)
Vectors (no matter which version you have, programs made for the old
version will still work)
Free (so people can GET it)
Languageless (don't force folks to use assembler, or Action! or BASIC XE)
(perhaps do it all via a handler or a pseudo-handler - vectors should
take care of this though. David Wyne Davies (sp?) had the perfect
idea- you set a value (0=open window, for example), the parameters,
and ALWAYS jump to the same location for all of the library routines)
Scaled-down versions (64K + disk/harddisk version available along with the
65816 + 4MB version - of course, some software will not be able to run
on certain setups, but that's the case already with some 128K/256K
software)
User-selectable interface (do it with a pop-up-in-the-middle menu, or
do it with a menu bar at the top of the screen or with menu bars at
the top of windows, or a menu column (a la NeXT-Step) - NO!! DON'T
PUT ALL OF THAT IN MEMORY!! The user loads the system up with
that version... see below)

I just had an idea.. say you had a directory (or disk) which you load the
system (ADOS or KOS or Diamond2000 or whatever the hell it'll be called)
from.

On it, each module sits..

WINDOWS.SYS
MENUS.SYS
POINTER.SYS
BUTTONS.SYS
etc.

Say I wanted to change the windows from blah things to 3D looking things
(say I was running it in multicolor mode (either multicolored text or
160x192x4 graphics mode)). I simply replace the system's "WINDOWS.SYS"
with a "WINDOWS.SYS" from another directory or disk (the "THREE_D" one).
I then restart the system. Instead of the plain vanilla window routines
being loaded into memory, the 3D ones are.. the difference may simply
be what they look like, but it could be more.

POINTER.SYS, for example.. It could be kind of like MultiMouse.. the interface to the system and programs is identical (mouse moving and clicking around the screen) but the interface to the outside world is different (joystick instead of mouse instead of trakball instead of keyboard).

Does everyone understand? I feel I haven't described this enough.. let me just say that instead of some huge "ADOS.COM" that you load, it's a small startup program.. It then loads in each of the above *.SYS files into memory... Get it????

I think this is a pretty awesome idea, actually :)

Source record: 89391

As somebody already said in the echo, the 1027 is NOT a thermal printer; the printwheel rolls against the ink roller (that thing on top-- it will pull straight out) to get the ink, and then print on plain paper.

I just went through getting one to work, and here's what I learned:

(1) Reink the roller with real printer ink; various places sell this. Just drop on a few drops. As I said, the ink thing is on top, and will pull off and push on.

(2) KEEPS YOUR HANDS AWAY FROM THE PRINTHEAD!!! I don't know what consistency those little wheels were when they left the factory, but they currently have the consistency of silly putty. ANY PRESSURE WHATSOVER you apply to the printwheels will cause distortion, and a printer with a few letters that do not print 100% (probably, most 1027s) will become one that won't print some letters at all, or will print unrecognizable letters.

(3) You can replace the power supply with a standard Atari 9-volt power supply; you'll just have to replace the connector at the end. It's a 3mm connector; I found one at Radio Shack. Even with the right connector, you may have to press around at funny angles to get it to fit in, but 3mm IS the right size.

It is quite simple. All you need to do is to open a socket up, with
the specified hostname and port. Once connected all one needs to do is
send the following text: "GET /your/url/filename.html" followed by 2
carriage returns. I utilized this in a simple cgi-bin perl script, which
allows people to register their homepages, to verify that the homepage
actually exists.
To play with this frm the shell prompt type:

```
telnet nimitz.mcs.kent.edu http
# wait until you get the connect message etc...
GET /~clisowsk/
```

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <143175@cup.portal.com>
Source record: 89397

Mathy, at least as far as 80 column video goes it is not a trivial hack.
I've been looking at it the last couple of months & some of the problems
you run into:
1) On just about any design you need what is called a dot clock. There
has to be a clock signal running at something like 7MHz<or 3.79??>.
Wooley beat this problem by completely replacing the clock circuitry
with 14.318MHz crystal and a counter chip so he could tap a pin for the
dot clock & a pin for the system clock & everything would run in sync.
Other designs used what is known as a phase locked loop. In the PLL design
you just use a clock source like the system clock & put a divider circuit
in the feed back, that way you can generate any multiple of the input
circuitry. IMO: The user group being what it is, at least 1/2 the people
would balk at Wooley's solution, not because it isn't good, but because
it requires major surgery or at least a daughter board. Ditto for the
the phase locked loop as far as a daughter board goes.
2) Large amount of area that's used by the design. Just about any design
using inexpensive chips will be based on either the 6545 or 6845 chip.
These are 40 pin devices & require either a ram or rom chip to use for
the character set. So right off the bat you're using at least
[40, 28, 28, 5 or 6 x 14] pins of chips. Just look at an old IBM CGA
card to get an idea! The bulk of the thing would have trouble fitting
into the case of anything but maybe a 1200xl. Leaves out another 80%
of the user group.
IMO: The design should be based on the cartridge slot. But this is limiting
also, for instance, Wooley combined the video signals so you could get
both the Atari video & the 80 column on the same screen. If you can't
mount the thing under the hood, this would be extremely difficult.
You'd have to use two monitors or just use one by plugging in the different
video source. I'm sure this would offend 90% of the user group.
I guess what I'm trying to say is we are all with opinions, & sometimes
these opinions run contrary to reality. i.e. an 80 column board that
will work in any Atari, combine video sources, you don't need a screw
driver to install it, & it sells for $10.
Rick

Yep. No lynx necessary.

>Rob - PLEASE explain how one could use HTTP (from the command line or
>a C program) to fetch HTML files.. :) :)

Well, I haven't delved much into the actual http protocol, but the
basic idea is that you connect to the host on the http port, then give
it the http command directly.

From the shell, the first thing you'd do is something like
telnet www.somebody.com 80

Then you use an HTTP "GET" command, and the server gives it to you.

For example, I was just able to get my Atari web page source (from a
totally different machine) like this:

[11] bottom 4:50pm /acs/magnusug/1/rfunk>telnet er4www.eng.ohio-state.edu 80
Trying 128.146.155.39...
Connected to camelot-o.eng.ohio-state.edu.
Escape character is '^]'.
GET /~funkr/Atari/

Some Atari 8-bit Stuff

.... and so on.

I know there is a perl script around here somewhere to do it; I don't
know C's networking functions well enough to describe, but I know perl
does it much like C.
I'll look it up after I get my new computer put together.
(I'd better not say what it is -- you guys would never let me in here
again! :-)
I wish I knew which RFC described HTTP; I have a link to the RFCs on
my main page, if you want to look around for it.

> new 8-bit os. Will the new one?

I'd like to point out that Diamond GOS was little more than a graphical
8-bit DOS. It did support some routines with which compliant software
could create a GUI, but that's about it. Needless to say, I never needed
a graphic DOS so much that I was willing to shell out $80 for it, and, as
I see it, neither did most Atari users.

> Also: BE ABSOLUTELY CERTAIN to include a command line

>

Regarding the CLI thing. I hate them. I have no qualms about having a
CLI running as a subprocess in a window (if you REALLY want one), but
it'll be a cold day in you-know-where before any of MY software is CLI
driven ;-). Let's face it, this is not the early 80s -- I can't believe
DOS and UNIX CLIs have survived this long much less that someone might
bring another into existance.

BTW, as the bumper sticker says, my OTHER computer is a Power Mac ;-)

1830. INSOMNIACS AUCTION DAY 5

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-04 00:00:00 UTC
From: jrm8248@u.cc.utah.edu
Message-ID: <3vu0ea$2g2@news.cc.utah.edu>
Source record: 89402

THE INSOMNIACS VIDEOGAME AUCTION!!!

HELP!!! I have so many video games, I cannot seem to sleep
at night. Please buy them now and save me from permanent
INSOMNIA!!!

This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

Remember to bid high and bid fast because if you don't, you
may miss your opportunity to own the games you really want.
And above all, remember to have fun!!!

Send Bids to jrm8248@u.cc.utah.edu

The rules to this auction are at the end of this message.

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Air-Sea-Battle, box is damaged $2.00 lgb

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $3.00 min

-Space War $3.00 ltravis

Atari 2600-LOOSE GAMES

-Adventure $2.00 mnathan

-Armor Ambush $1.00 johnsose

-Basic Math: Atari, cx-2661

-Bowling: Atari

-Boxing: Activision $1.50 lgb

-Canyon Bomber: cx-2607 $2.00 ltravis

-Circus Atari: Atari $2.00 ltravis

-Chopper Command $1.00 mnathan

-Codebreaker

-Crystal Castles: Atari $5.00 lgb

-Defender: Atari $1.00 johnsose

-Demon Attack

-Enduro: Activision

-Flag Capture: Atari cx-2644 $1.00 johnsose

-Freeway: Activision $1.00 mnathan

-Ghostbusters: Activision $3.00 ltravis

-Golf: cx-2634 $1.00 johnsose

-Gorf: CBS Video Games $2.00 johnsose

-Hangman: Atari

-Human Cannonball: Atari

-Ice Hockey: Activision $1.00 ltravis

-Joust: Atari $1.00 lestermi

-Kool-Aid Man: General Foods Corp. $5.00 ltravis

-Marine Wars: Konami $10.00 Bill

-Millipede: Atari $1.00 lestermi

-Night Driver: Atari $1.00 johnsose

-Outlaw: cx-2605 $1.00 johnsose

-Popeye: Parker Brothers $1.50 lgb

-Pitfall: Activision

-Atari 2600 jr, no cables does work $4.00 min

-Atari 2600 jr, no cables does not work $2.00 min

-Atari 2600 Paddle Controllers $3.00 cmalone

-Atari 800XL, no cables $8.00 JimT

-Atari 1200XL no cables $8.00 min

-Atari 1050 Disk Drive, no cables $8.00 JimT

-Colecovision, w power supply, joysticks $27.00 paladin

-Commodore 64 Computer, w/ power supply, in box $10.00 johnsose

-Commodore 1541 Disk Drive, w/ cables $10.00 johnsose

-Intellivoice for Intellivision Systems $6.00 min

-Odyssey2 in box with cables not working $1.00 min

-Texas Instruments 99/4A box + cables $10.00 min

-Texas Instruments 99/4A Speech Synthesizer $6.00 johnsose

ATARI 2600-excess

-Pac-Man
-Combat
-Asteroids
-Defender
-Missle Command
-Space Invaders
-E.T

Send all bids to: jrm8248@u.cc.utah.edu

HERE ARE THE RULES:

1. This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be INSOMNIAC BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $3.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated.

1831. Re: Iomega Zip FAQ 1.5

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-05 00:00:00 UTC
From: schuster@panix.com
Message-ID: <3vvnhb$oqd@panix3.panix.com>

Cross-posted to: comp.sys.mac.hardware.storage,comp.sys.ibm.pc.hardware.storage,comp.sys.atari.st.tech,comp.sys.atari.8bit,comp.sys.amiga.hardware

Since you asked for additional questions:

How are media defects handled? Does a formatted Zip disk ever return "bad sectors" to DOS? If not, does the formatted disk have spare sectors for silent replacement? How many? What happens when it runs out? Is write verifiction performed during i/o? What are Iomega's criteria for accepting a disk as defective uner warranty (relate to answers to above questions on defect handling).

You might also point out that, cabling difficulties aside, the SCSI Zip cannot be used **ALONE** with the Adaptec/Trantor MiniSCSI series of parallel-to-SCSI adaptors because they require TERMPOWER which, stupidly, the Zip drive does not provide. They will work, however, if (still further cabling difficulties aside) another SCSI device is in the daisy chain which does provide TERMPOWER.

Please consult the Iomega board press release for the Zip. It clearly
states that higher capacity is merely a matter of media refinement...not
of the electronic or mechanical aspects of the Zip.

The implication is that 200 mbyte disks are possible.

Now..since they are making huge sales of these things as is, I don't
expect to see 200 meg disks for a long while (9 months to a year)..or
earlier if they are threatened by another product.

Note that no one at IOMEGA will absolutely DENY the possibility of higher
capacity disks for the Zip 100...however, it IS called the Zip 100.

Roger, I disagree. I doubt that you could merely stick a '200 meg
disk' into a zip drive and have it act as 200 megs... that'd be like
sticking a 2.88 meg floppy disk into a 1.44 and expecting it to
work...

At the very least, it would require a software rewrite, and PROBABLY a
firmware change in the zip drive... packing more data on the disk
would require actually putting the sectors closer together, which
would require the heads to move in completely different ways...

Besides, they've got the Jaz drive coming out in a few months, and
that'll wipe out ANY other removeable storage product, rewritable
optical, and Magneto-optical excluded.

Physical dimensions, press ratings, FAQ locations, contact information, etc.

SECTION 2: GENERAL ZIP-RELATED ISSUES
Q1: What is the Zip drive?
Q2: What's the deal with the cartridges?
```

Q3: Can the Zip drive use other types of media?
Q4: How fast is the Zip drive?
Q5: Does the Zip drive use Bernoulli technology?
Q6: It's such a new drive...How does it rate in terms of quality?
Q7: What if I want to buy one Zip drive for use on several different
machines?
Q8: What other goodies are offered with Zip?
Q9: Any other things, good or bad, that I should know?
Q10: I want more information and, gee-golly-gosh-darn-it, this FAQ just
isn't enough! How can I get in touch with the folks who make the Zip?

SECTION 3: PORTABILITY CONCERNS
Q11: Is the Zip drive available with a power supply of 220/240 volts
so that it will work in other countries?
Q12: Does that "Universal Power Supply" include all ten billion adapters
to fit the various electrical outlets of the world?

SECTION 4: MACINTOSH ISSUES
Q13: Will the Zip drive work with System 7's virtual memory?
Q14: Can you boot a Mac from a Zip disk?
Q15: Will Zip work with a PowerBook?

SECTION 5: PC ISSUES
Q16: What's a Zip Drive-SCSI for PC?
Q17: What's this Zip Zoom SCSI adapter all about?
Q18: What about booting a DOS/Windows machine from the Zip drive?
Q19: My PC doesn't have a SCSI adapter. What do I do?
Q20: How fast is the parallel version of the Zip drive?
Q21: No, really, how fast is it in Real Life?
Q22: Why would I want a parallel version instead of a faster SCSI version?
Q23: Windows blows chunks; I use OS/2. I guess I have to buy the OS/2 Zip
Tools from Iomega, right?

SECTION 6: MAC AND PC INTEROPERABILITY
Q24: Can the Mac read PC-formatted Zip disks, and vice-versa?
Q25: Can I use the Zip drive with both my Mac and my PC?

SECTION 7: OTHER PLATFORM ISSUES
Q26: Does the Zip work with other, non-Mac and non-PC platforms?
Q27: What's been reported so far that works and doesn't work?

SECTION 8: ZIP AND IOMEGA RUMORS AND NEWS

SECTION 9: BENCHMARK RESULTS

SECTION 10: IOMEGA ZIP vs SYQUEST EZ135
- - - - -
NOTE: Unless specified otherwise, all transfer rates and access times
listed throughout this FAQ are in reference to the SCSI version of the
Zip drive when connected to a Macintosh IIci w/DayStar 33Mhz 68LC040
accelerator and 32-MB RAM running System 7.5.1.

UK MacUser (June 9 1995), 5 stars (5=top rating)

This FAQ is posted on an as-needed and as-completed basis to the following Usenet newsgroups: comp.sys.mac.hardware.storage, comp.sys.ibm.pc.hardware.storage, comp.sys.atari.st.tech, comp.sys.atari.8bit, comp.sys.amiga.hardware. This FAQ will also be uploaded to the two most popular Macintosh ftp sites (sumex-aim.stanford.edu and mac.archive.umich.edu) for placement in whatever directory the supervisor(s) of those sites deem appropriate.

If you have a Zip-related question which you'd like to see directly addressed in this FAQ, please send mail to the appropriate users -- and PLEASE make sure you address them properly. While I can appreciate the need for answers to your PC-related questions, as a Macintosh enthusiast I (steveg@phantom.com) simply do not have the answers you seek, so PLEASE STOP MAILING ME with PC questions!

For Mac Q&A.....steveg@phantom.com
For PC Q&A.....lee@library.ucsb.edu (who will forward the answer to me for inclusion in the next edition of the FAQ)
For all other platforms...Until we get appropriate "Zip Gurus" on other platforms, post questions to your local usenet newsgroup(s) that relate to your platform.
- - - - -
***SECTION 2: GENERAL ZIP-RELATED ISSUES

Q1: What is the Zip drive?
A1: The Zip drive is a new drive from Iomega Corporation, makers of the Bernoulli line of removable storage devices (competing primarily with drives from the SyQuest corporation). The drive uses proprietary cartridges providing 100-MB unformatted storage capacity (25-MB cartridges are expected to be released soon). The drive was first

advertised in the catalog pages of MacWarehouse (a popular mail order company) several months before the drive began shipping. As a result, a huge backorder was created even before the first drives began trickling out. After the drives began shipping in earnest, other mail order companies and local retailers began advertising and selling them. Waiting periods ranged from a few days to over a month, depending on which vendor you ordered from and exactly when you ordered.
The drive itself is rather small (slightly larger than the typical Supra modem), and weighs less than one pound (including disk). The case is a cheap-feeling but reasonably sturdy dark blue plastic affair with six gray rubber feet attached, allowing the drive to be set flat (like a typical modem) or on edge. A green LED on the front of the drive indicates that the drive has power, while an orange LED next to it acts as a busy light. A small round gray button is set below the two LEDs and acts as an eject button. (When the drive is connected to the Mac, the disk is automatically ejected like a floppy disk when the disk icon is dragged to the trash can. If you have a disk installed and the computer is not turned on, pressing the button on the drive will eject the disk.)
A clear plastic window is on the top of the drive allowing the user to see the label of an inserted disk. The back of the drive has two 25-pin SCSI connectors. Between the two connectors are two switches; one allows the user to set the drive between SCSI ID 5 and 6 (those are the only two options available), while the other provides termination (ON if the Zip is the last device on the SCSI chain, OFF if there are devices on either side of the SCSI chain). The power inlet is located on the side of the drive (on the same side that would face down if the drive were positioned on its side) and provides both a recessed power connector and a recessed power cable guide for aesthetically routing the power cord.
The drive uses regular magnetic-type read/write heads to store data; it is not a magneto-optical drive, removable hard drive, etc. The best way I can describe it is as "a 100-MB floppy drive that's about as fast as a hard drive."
The drive ships with an external two-prong power supply (which weighs slightly more than the drive itself!), one 100-MB "Zip Tools" cartridge containing many excellent utilities for formatting, indexing and backing up your data, two floppy disks for installation (one for Mac, one for PC), a thin but complete owner's manual, a shielded 25-to-25 pin SCSI cable, and the usual assortment of promotional goodies. Setting up the drive takes only a few minutes.

Q2: What's the deal with the cartridges?
A2: As of this writing, only 100-MB cartridges are shipping. Each cartridge has an unformatted capacity of 100-MB; after formatting, they provide about 95-MB of storage capacity. Cartridges cost between $15 and $25 apiece depending on vendor and quantity purchased. Each cartridge measures about 3.875" square and are about .25" thick. They come in a hard clear plastic fold-out case, similar to a magneto-optical disk. The cartridges are prelabeled; replacement labels are available from Iomega for a rather pricey $3 for a package of 10. Iomega plans to have 25-MB cartridges available soon. Cartridges can be formatted with just about

any low-level SCSI formatting utility, though no significant performance or capacity differences were noted between using the different formatting utilities. Programs such as TimesTwo for the Mac (by the now-defunct Golden Triangle) or Stacker for either the Mac or PC can be successfully used to format the disks to an artificial 200-MB each, but I wouldn't recommend it for several reasons. Besides, the cartridges are cheap enough to store data without compression.
Several people have reported that MS-DOS formatted Zip disks seem to be in more plentiful supply than Mac formatted Zip disks, presumably because the Zip drive isn't making as big a splash in the PC world since they have never had as strong a deficit of low-cost, high-capacity secondary storage devices that the Macintosh has had to suffer through. If you can find PC formatted Zip disks, snag 'em; they can be easily reformatted to work on the Mac. (And vice-versa, if the need is there.)

Q3: Can the Zip drive use other types of media?
A3: The Zip drive and its cartridges _are_not_compatible_ with any other media or drive. A Zip drive cannot read/write/format/recognize magneto-optical disks, floppy disks, SyQuest cartridges, Bernoulli cartridges, DATs (or other types of tape cartridges), or any other sort of non-Zip media.

Q4: How fast is the Zip drive?
A4: Like any SCSI device, overall performance will vary depending on what system and configuration is used. The shareware Macintosh benchmark utility Speedometer 4.0 gives the drive a rating of .794, which is slightly faster than the 44-MB SyQuest drive that I tested as a comparison device (and gave a rating of .736). This is fast enough to run most software; QuickTime movies run quite smoothly from Zip disks, as do sampled sounds and similar time-specific files. (See more detailed ratings at the bottom of this FAQ.)

Q5: Does the Zip drive use Bernoulli technology?
A5: No, not at all. The Zip drive is a sort of hybrid of modern drive assembly techniques and established Winchester-type drive mechanisms. The Bernoulli Effect, and the technology that Iomega applies to it, is not to be found in this drive.

Q6: It's such a new drive...How does it rate in terms of quality?
A6: Only time will tell for that, of course. It is my personal feeling, and the overwhelming feeling of most of the Zip owners on the internet, that the Zip drive is quite solid and reliable. I've personally put about six hundred consecutive hours of access time on my Zip drive and had nary a single problem. I've transported the drive in a plain plastic grocery bag to work and back (a half hour New York walk) and hadn't had a problem with it. The drive is tightly constructed, though some may think it feels cheap. My personal drive survived numerous leg-bumps while walking to and from work and survived without a single scratch or performance defect.

Q7: What if I want to buy one Zip drive for use on several different machines?
A7: If they're all Macs, you're set. Just install the Zip Tools software

on each machine and off you go. Of course, you'll need to physically move the Zip drive from one Mac to another as well. If you're dealing with a mixed Mac and PC environment, your options change. If your PC has a SCSI card you can plug the Zip drive into it, install the PC Zip Tools, and away you go. If you don't have a SCSI card on your PC, Iomega offers a ZIP SCSI adapter for $60 (Iomega part #10013). If you don't want SCSI on your PC, you can buy the parallel version of the Zip drive. It offers all the same features of the SCSI Zip drive, but it interfaces with the more common parallel connectors on PC's.
The hardware interface is easy; connect it as you would any other SCSI device. The potential problem lies in the Zip Tools software. Iomega only packages the Zip drive with Zip Tools for Mac and PC running Windows (they also offer the Zip Tools package for OS/2; this disk costs an additional $20 and is Iomega part #10045).

Q8: What other goodies are offered with Zip?
A8: A small color brochure is included with the drive selling such items as carrying cases, Zip disk holders, extra Zip disks (which are more expensive than mail order and some retail outlets), Zip disk labels, Zip SCSI cables, the aforementioned PowerBook adapter, power supplies, Zip SCSI cards, and Zip Tools for the three mentioned platforms. It is mentioned in the Zip documentation that a Zip drive cleaning kit is offered through Iomega; however, there is no evidence of this kit in the color brochure. (Note that the Zip drive CANNOT be cleaned with a conventional floppy drive cleaning kit, so don't try it!)

Q9: Any other things, good or bad, that I should know?
A9: There are some issues which some people find fault with which I'll point out here. First, the drive has no POWER switch. When the drive is plugged into an active electrical outlet, it's on; when it's unplugged, it's off. I personally have no problem with this as my drive is plugged into a switchable power station (Kensington MasterPiece Plus; no affiliation, though I think this is an excellent unit) and I can turn it off and on with the station's button.
The drive also has only two SCSI ID options (5 and 6), which means that if you have a relatively full SCSI chain, you may find yourself switching the ID's of other devices on the chain.
As was previously stated, the drive has two 25-pin SCSI connectors and ships with a 25-to-25 pin SCSI cable. For most users with multiple SCSI devices, this means that the Zip drive will be the first drive on the SCSI chain and other devices will plug into the Zip drive. If you happen to have a spare 50-to-25 pin SCSI cable, you can place the Zip drive on the end of the SCSI chain (thus eliminating the need for external terminators, since the Zip has switchable termination) by connecting the 50-pin end to your formerly-last SCSI device the the 25-pin end to the Zip drive. This is NOT to say that the Zip drive couldn't be placed in the middle of your SCSI chain. It certainly can; the only thing you'd need to accomplish this is the appropriate SCSI cables (25-to-25 and/or 25-to-50, depending on your other devices).
The drive is VERY quiet. For some, this is a blessing; for others, a curse. The drive makes a quiet (library-level) clicking sound as the

read/write heads move across the disk, but that's about it. Do not rely on auditory feedback to determine the status of the Zip drive. :-)
The drive also has a power saving mode. When the drive is not accessed for a few minutes, the drive kicks down into a low-power mode. When the drive needs to be accessed while in low-power mode, it only takes about a second for the drive to get back into action (considerably less time than it takes for a PowerBook's hard drive to spin back up).
When inserting a disk, there is no lengthily spin-up time like a SyQuest drive so the disk is almost instantly available. When a disk is ejected, there is no spin-down time so the disk ejects at least as fast (if not faster) than a floppy disk, and leaves the drive with a very solid and satisfying "ker-CHUNK" sound.

Q10: I want more information and, gee-golly-gosh-darn-it, this FAQ just isn't enough! How can I get in touch with the folks who make the Zip?
A10: It turns out that there's a whole lot of different ways you can contact Iomega. If you're still living in the Stone Age (or, perhaps more appropriately, the Stamp Age), you can write them: Iomega Corporate Office, Iomega Corporation, 1821 West Iomega Way, Roy, Utah 84067-9977, USA. The voice telephone number for their corporate offices is 801-778-1000, but DON'T call there unless absolutely necessary. Iomega has been smart enough to supply about half a dozen alternative telephone resources. An Interactive Voice Help system (24 hours) is available at 1-800-456-5522 (or 801-778-3000 if you're in the area code). Sales Information is at 1-800-MY-STUFF (1-800-697-8899). An automated FAX assistance system (US and Canada only; 24 hours) is at 801-778-5763. But wait! There's more! Iomega operates a BBS at 801-392-9819. They're on CompuServe (Mac users type "GO MACCVEN", PC users type "GO PCVENE") and America Online (keyword "IOMEGA"), and they have an internet email address at info@iomega.com. Finally (?), they operate a Web page at http://www.iomega.com/. Whew!
- - - - -
***SECTION 3: PORTABILITY CONCERNS

Q11: Is the Zip drive available with a power supply of 220/240 volts so that it will work in other countries?
A11: Yes and no. By itself, the Zip drive ships with a USA-standard power supply which can't be used everywhere around the world. However, Iomega sells a "Universal Power Supply" (item #10044) for $40 which, according to Iomega documentation is "smaller, lighter, and usable worldwide". I've received some reports from several people who state that this power supply works in several different countries. Zip owners in the USA who travel within the country with their Zip drive may want to consider this power supply as it is indeed smaller and lighter than the standard power supply (almost half the size, in fact) and would make portability that much easier.

Q12: Does that "Universal Power Supply" include all ten billion adapters to fit the various electrical outlets of the world?
A12: No. You get the small device pictured in the catalog as well as a standard computer peripheral power cable. If you want to plug it in

anywhere else in the world, you're on your own for adapters. (Radio Shack, among many other vendors, sells adapter plugs for various world ports.) This is not an Iomega part; you might be able to get it faster by ordering it from somewhere else (it is from Advanced Power Solutions and is model #SA-051A5F-10).
- - - - -
***SECTION 4: MACINTOSH ISSUES

Q13: Will the Zip drive work with System 7's virtual memory?
A13: Like all other removable storage devices, no, it will not work. It is my understanding, however, that other virtual memory programs exist which can use removable storage devices (and, as such, the Zip drive) as VM storage, but that's a subject for another FAQ. :-)

Q14: Can you boot a Mac from a Zip disk?
A14: Yes, you can. There are two ways to accomplish this. (The following instructions assume that you have a Zip disk with the proper System software installed on it.)
First, when the computer is up and running, insert a Zip disk. Open the "Startup Disk" control panel and select the Zip disk as your startup disk. While holding down the OPTION key, select RESTART from the SPECIAL menu; holding down OPTION prevents the Zip disk from being ejected. (If for some reason the Zip disk IS ejected after you select RESTART, simply reinsert the Zip disk BEFORE the "happy Mac" icon comes up and you'll be in business.)
The second way is a bit different and assumes that your computer is turned off, but the startup disk is the hard drive you usually boot from. Power up your Zip and insert the Zip disk. Boot your Mac while holding down the SHIFT, COMMAND, OPTION, and DELETE keys; this forces your Mac to bypass the internal hard drive and should cause your Mac to boot right from the Zip disk.

Q15: Will Zip work with a PowerBook?
A15: Absolutely! However, you'll need to invest in an HDI-SCSI adapter; Iomega sells this for $20 and is part #10042. Other manufacturers sell this type of adapter at comparable prices.
- - - - -
***SECTION 5: PC ISSUES

Q16: What's a Zip Drive-SCSI for PC?
A16: It's the same thing as a Zip drive for Mac. Depending on your SCSI interface, it should be about the same speed. Iomega sells an inexpensive ($54) SCSI card for the Zip drive called the Zip Zoom (see below). The software for both Macs and Windows ships with the drive; if you're using OS/2, you'll need to purchase the Zip Tools software separately from Iomega for $20.

Q17: What's this Zip Zoom SCSI adapter all about?
A17: It's a SCSI-1 ISA card based on the Adaptec 1505 and has an external 25-pin SCSI connector. It doesn't have an internal SCSI connector, but it does seem to allow you to chain other SCSI devices off of it either before or after your Zip drive. If you want SCSI-2 or a bus-master card

(?) then you may want to buy a different SCSI card. Infoworld (5-1-95) reports backing up 397-MB in 57 minutes (6.97-MB/minute) and restoring that same data in 27 minutes (14.7-MB/minute) with the Zip Zoom adapter.
J Greely <jgreely@Synopsys.COM> reports:
"Most SCSI controllers come with a driver for controlling non-standard SCSI disk devices (c.f. Adaptec EZ-SCSI ships with ASPIDISK.SYS); this will work with a Zip drive, but you won't be able to use the Zip Tools for formatting, locking, etc. One nice side effect of using a non-Iomega driver is that the installation will be unable to erase the disk, so you'll still be able to use it for a Mac installation afterwards.
"Some PC SCSI cards are too bright for their own good; a QLOGIC card I bought insisted on controlling the Zip drive itself, making it impossible to use the Zip tools. I replaced it with an Adaptec 1522, and all was well."

Q18: What about booting a DOS/Windows machine from the Zip drive?
A18: That depends on your SCSI adapter. The Zip Zoom doesn't support booting from the Zip drive, though other SCSI cards may.

Q19: My PC doesn't have a SCSI adapter. What do I do?
A19: You can either buy a SCSI adapter (from Iomega or from somewhere else) and run with it, or you can buy the Zip Drive-Parallel, which is (obviously) a Zip drive that plugs into a PC's parallel port.

Q20: How fast is the parallel version of the Zip drive?
A20: According to the readme.txt file, the transfer speed for standard parallel port is 2-6-MB/minute, bi-directional parallel port is 6-17-MB/minute, and enhanced parallel port is 17-22-MB/minute.

Q21: No, really, how fast is it in Real Life?
A21: Huei-Chin Lin <hueichin@macc.wisc.edu> reports:
"I had transferred a 12-MB zipped file from my Zip-disk to my hard drive, and roughly timing it. It took about a minute to transfer a 12-MB file from Zip disk to my hard drive. (My computer is 486DX2-50 with 8-MB RAM.) I had even zipped my whole window directory and subdirectories to my Zip disk, and it is only a bit slower than the speed I've got when I zipped the same thing to my hard drive (remember that I was using EPP capacities and I only tested it without any benchmarking)."

Q22: Why would I want a parallel version instead of a faster SCSI version?
A22: Not all PC's have SCSI adapters and you may not want one, so the parallel drive would be for you. Other than that, it's a matter of personal preference.

Q23: Windows blows chunks; I use OS/2. I guess I have to buy the OS/2 Zip Tools from Iomega, right?
A23: Right -- unless you don't want to. Zip Tools for OS/2 is reportedly available on Iomega's own BBS, so the only thing it'll cost you is the phone call and download time.
- - - - -
***SECTION 6: MAC AND PC INTEROPERABILITY

Q24: Can the Mac read PC-formatted Zip disks, and vice-versa?
A24a: For the Macintosh, yes. You will need a utility that will read PC-formatted disks. PC Exchange, which is included with System 7.5, works with mixed results. Several people have reported errors ranging from the inability to read the disk to outright trashing of the data on the disk, while others claim no problems with the utility. The general consensus seems to be that other programs, such as Access PC, work better than PC Exchange.
A24b: On the PC, I have no verified information on this.

Q25: Can I use the Zip drive with both my Mac and my PC?
A25: Yes. In fact, Iomega ships the drive with floppies for both Macs and PCs, but there's a catch. As soon as you run the program to install the Zip Tools utilities that are included on the Zip Tools disk, the installer will erase the partition (about 50-MB) of the system that you are NOT installing it for. (So if you run the install program from a Mac, it erases the DOS partition and vice versa.) Iomega's official position is that you have to buy a second Zip Tools disk if you want to install on both platforms, but of course that's not the only recourse. You have several ways to get around this.
The first solution (and, by far, the most convenient) is to run the Guest program from the Zip floppy disk to mount the Zip Tools disk, then use a disk duplication program (one that gets the whole disk, sector by sector) to dupe the Zip Tools disk onto a blank Zip disk. Some people have reported doing this successfully with the Disk Duplicator program that is on the Macintosh partition of the Zip Tools. Once you have a duplicate of the Zip Tools disk, you can use one to install for your Mac, and then the other to install for your DOS/Windows machine.
A second solution -- and the only recourse you have if you've already installed the Zip Tools software on one platform (thus deleting the other platform's software from the Zip Tools disk) -- is to go to Iomega's SIG on America Online. The files are available in their software library:
ZIPTOOLS.EXE ....Part one of the Zip Tools package for PC
FIND.EXE ....Part two of the Zip Tools package for PC
IOSCSI.EXE ......Iomega SCSI drivers, including the Zip Disk drivers for PC
Zip Tools version 4.2.1 .....The whole Zip Tools package for Mac
For Mac users, you'll need only that last file which contains the entire package. (NOTE: As I'm not an AOL subscriber, I don't know what format this file is. If someone would like to research this and get back to me, I'd appreciate it!) Those PC files are self-extracting archives, so for God's sake be careful! Make a directory called \ZIPTOOLS, move the ZIPTOOLS.EXE file in there and run it from that directory. Make a subdirectory \ZIPTOOLS\FINDIT, move FIND.EXE into it, then run that (from the FINDIT subdirectory). For further instructions, read the README.NOW file in the \ZIPTOOLS directory. To install the SCSI drivers, make a directory called \IOMEGA, and move the IOSCSI.EXE file there. Now run it from that directory. Run MANUAL.EXE and read how to install it. You can use the INSTALL program or do it manually.
- - - - -
***SECTION 7: OTHER PLATFORM ISSUES

Q26: Does the Zip work with other, non-Mac and non-PC platforms?
A26: Yes, but it's a mixed bag. Most other platforms (i.e., Apple II, Atari 8-bit, Atari ST, Amiga, Commodore 64) have some sort of SCSI interface option wither built-in or available as a third-party expansion box or card, so physically connecting the SCSI version of the Zip drive is as simple as plugging in a cable. The greater issue lies with software; Zip Tools is available only in Macintosh, PC/Windows, and OS/2 flavors so everyone else is pretty much on their own.

Q27: What's been reported so far that works and doesn't work?
A27: Not a whole lot of adventurous souls out there, unfortunately. It has been reported and confirmed that the SCSI Zip drive works with Atari 8-bit computer with the "Black Box" interface unit and SpartaDOS. As the Atari 8-bit cannot recognize any partition larger than 16-MB, SpartaDOS must format the Zip cartridge as multiple partitions in order to fully utilize the entire Zip cartridge.
I have also had 2-3 vague reports of the SCSI Zip drive working nicely with the Amiga computer, though nobody who uses that platform has contacted me with verification and specific details.
A similarly vague report has been sighted from an Atari TT user, though again, nobody who uses that platform has contacted me with verification and specific details.
- - - - -
***SECTION 8: ZIP AND IOMEGA RUMORS AND NEWS

CONFIRMED: Power Computing, the first licensed and authorized manufacturer of Macintosh clones, now has an internal Zip drive for the Power Computing clones available as optional equipment. Furthermore, Iomega has publicly stated that they're working on an internal version for end-user installation in other machines. I do not have final pricing information on this option; I expect to see Power Computing at Boston MacWorld Expo and will seek the information then.

CONFIRMED: Iomega is working on a larger capacity removable storage drive now known as the "Jaz" drive. The Jaz drive is expected to cost ~$500 for the internal version (~$600 external) and use ~$100 3.5" cartridges that hold 1-GB apiece. The drive resembles a larger version of the Zip drive but is colored dark green rather than dark blue; the cartridges are about twice as thick as a Zip cartridge. Further information is expected at Boston MacWorld Expo.

CONFIRMED: At a recent MacWorld Expo in San Francisco, Iomega was giving out "dummy" Zip cartridges, presumably as some sort of promotional gimmick. If you have one of these dummy cartridges, return it to Iomega and they will send you one real, 100% usable Zip cartridge, absolutely free. Joy!

RUMOR: A longstanding rumor about a 200-MB Zip drive has touched just about everyone's screens. To the best of my knowledge, this rumor started when, in an interview regarding the Zip drive, an Iomega executive made a statement to the effect that "Zip technology is at its infancy" and that "it would be easy enough to make a Zip drive that can store twice the current amount or more." Needless to say, many people took this to mean

that a 200-MB Zip drive is in the works. As best as I've been able to ascertain, *a 200-MB Zip drive, if it ever comes to light, will not be available anytime soon*. Realistically speaking, this makes lots of financial sense for Iomega. 100-MB Zip drives are selling faster than Iomega can make them; if they make a 200-MB drive available now (or within the next month or three), that will instantly cut 100-MB Zip drive sales down to the bone as people wait for the 200-MB drives. Why cut their own throats? I don't doubt that larger capacity Zip drives will *eventually* come to light, but I also believe that it'll be at least half a year before we see them. (The Jaz drive that is being developed may be the drive which this rumor sprouted from.)

- - - - -

***SECTION 9: BENCHMARK RESULTS

Many people had requested more solid reference numbers to compare the SCSI Zip drive with other types of storage devices. Okay; here ya go. These results were obtained using Norton Utilities 3.1's "System Info" program on an accelerated Mac IIci (DayStar Turbo 040i @ 33Mhz) with 32-MB RAM (real RAM) running System 7.5.1 and with no non-System-7.5 extensions loaded except for the Iomega Driver; disk cache was set to 256K. The IIci's hard drive and the SyQuest were formatted with Silverlining 5.54/23; the Zip was formatted using Iomega Tools 4.2, though identical results were obtained when the Zip cartridge was formatted with Silverlining. Note that specific results will vary a bit from machine to machine due to CPU speed, system configuration, specific architecture, etc.

- - - - -

***SECTION 10: IOMEGA ZIP vs SYQUEST EZ135

SyQuest will soon be releasing a new drive called the "EZ135" (formerly known by its code name, "Roadrunner"). This drive will reportedly cost ~$230 for an external version (~$200 for an internal version) and use ~$20 cartridges that store 135-MB each. EZ135 weighs about 2-3 lbs (considerably more than the diet-conscious Zip), but is also about twice as fast.

There are many mixed messages about which drive will ultimately prevail. However, I personally feel that the Zip drive will be the winner for several reasons. Here's why:

* The Zip drive is cheaper. Zip costs $200 for external, while EZ135 is ~$30 more. Furthermore, the Zip drive is now available internally from Power Computing and soon as an end-user installation kit, and chances are it will cost considerably less than the EZ135's internal price of $200.
* Zip cartridges are smaller, lighter, and more transportable. EZ135's cartridges will likely need to be stored in the same sort of padded carrying case as "standard" SyQuest cartridges. As a result, you'll see less of them being used with portable computers and, consequently, with desktop machines.
* Zip already has a substantial market lead over SyQuest. Historically speaking, the Mac market hasn't had much in the way of brand-loyalty. SyQuest drives became the predominant standard not because of any outstanding features, but simply because they were cheap in comparison to the more expensive Bernoulli drives. However, I can count literally hundreds of people who have abandoned their SyQuest drives for the Zip drive.
* The Zip is being offered as optional equipment in Power Computing's Mac clones (and hopefully -- eventually -- Apple's own products), whereas the EZ135 is not. This has the potential to give the Zip drive an even larger marketing lever.
* Though EZ135 is faster, Zip is already fast enough for the majority of users. QuickTime movies, sound files, and similar time-intensive files play just fine from Zip. Only a comparatively few users will actually _need_ the additional speed that EZ135 offers, and when you consider this in relation to everything else, the EZ135's speed becomes a not-so-important factor.
* EZ135 cartridges hold about 30-MB more data after formatting, true, but is that enough to justify a more expensive, heavier drive? I don't think so. Again, the fact that the Zip is so easily transportable makes it the better drive, regardless of the data storage capacity. If SyQuest's new drive were to hold, say, 200-MB or more it would be a considerably different story.
* People may be angry at SyQuest for "holding out" on the community. More than a few users have wondered out loud why SyQuest didn't introduce the EZ135 before Zip came on the scene. The most logical answer is that SyQuest was making so much money off its other, lower-capacity drives that they didn't want to rock the boat by introducing the EZ135. Only when Iomega started severely cutting into SyQuest's market did SyQuest respond with the EZ135. In short, it seems that SyQuest was more interested in lining its own pockets instead of advancing the technology. While this is probably good for business, it doesn't make the users any happier.

It's ultimately a simple matter of time deciding which drive will prevail, but if I had to place money on the outcome, I'd bet on Zip.
- - - - -
Well, that was fun.

Source record: 89407

Richard is right. QUICK certainly is not dead, we just haven't found
a distributor in the USA. If someone is interested - just mail me.

There is an english version of the manual and every year there is
a new QUICK support disk in Germany, and sometimes we even do new ones in
english, too.

If anybody is interested in getting the international QUICK version, just
contact me or Dean Garraghty.

Harald Schoenfeld

All, I have a miniscribe micro mainframe 5 1/4" disk drive. It
unfortunately came with no docs but someone pointed out the
connectors and switches to me - and now I am really curious.
What all can be supported? How? If anyone has docs -
address of company - or info on this tank - I would really
appreciate it. Thanks, Wayne Booth

1839. Atari Emulator for Unix and Amiga - 0.1.8

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-05 00:00:00 UTC
From: David Firth <david@signus.demon.co.uk>
Message-ID: <1995Aug5.172954.225@signus.demon.co.uk>
Source record: 89411

I have just upload the latest version of this emulator. It can be
obtained from:-

ftp.demon.co.uk:/pub/emulators/Atari800-0.1.8.tar.gz

ftp.demon.co.uk 158.152.1.44

The latest version will also run on an Amiga with the AGA chipset. It
can be compiled using either DICE C or GNU C (See Makefile). Speed wise,
the Amiga version is currently the slowest (Sorry!), however I am
optimistic that this will be improved over the comming months.

Changes in 0.1.8

- Allows direct use of GRAFP0, GRAFP1, GRAFP2, GRAFP3 and GRAFM without
using DMA.
- -rom16 option to load standard 16K ROMs.
- -a option to load object/atariosa.rom
- -b [default] option to load object/atariosb.rom
- Simplified screen generation for host - Player missile graphics
collision detection has been moved into 'atari_custom.c'
- Corrected read from PORTB (XL/XE emulation)
- GTIA support for *all* antic modes.
i.e. GTIA can be enabled in graphics mode 0 (antic mode 2) just like
a real 800. POKE 623 with 64, 128 or 192 to test.
- Amiga version can be compiled using either DICE C or GNU C - see Makefile

Changes in 0.1.7

- Issue cpu cycles during screen update (corrects VCOUNT problem)
As a result DLI are not occuring on the correct mode line.
- Support for 256 bytes/sector ATR files
- Handle Insert, Delete and Tab keys properly
- Handle Shift + Control + A-Z properly (X11 only)
- Cartridge support tidied up (Thanks to Dave Bennett)

The main difference with telnet is that you have to break the URL into
its parts.

>Hmm... one thing, however.. how will I tell when the data is finished? :)
>Perhaps it's time to rething this :) (perhaps a "set prompt ***DONE***"?)

With telnet, you'll get "Connection closed by foreign host." at the
end. But if you test for any particular string, you're screwed if the
html page happens to include that page. If you directly connect with
your own C program, you'll know when the server closes the connection.

I do see one advantage to using lynx: it might recognize other URL
types besides http, such as ftp.

I mailed you the "wwwget" perl script I have that gets http://...
pages, but you probably know that by now. :-)

Nor do we need another pretty interface that is nearly useless.
(Program Manager, anyone?)

I don't want to start a religious war here, but I think the best
approach (without considering technical limitations) is a GUI with a
CLI window. A command line is harder to learn, but MUCH more flexible
and powerful than straight icons and buttons and menus.

My favorite interface is X-Windows with at least two xterm windows
running a Unix shell.

What is the best way to get started in this game? Where do I find money and/or equipment? You start out with ~120 copper, which is not nearly enough for any weapons I saw at the Smithy. And I can't win any fights with bare hands...though I once killed a courier by trying to charm him, and "earned" about 120 XP> :)

Seriously, though...how can I get to the point where I can survive any encounters with fighting?

And I remember when I though it was hard to start Ultima II...

In article <3vug05$5lv@bug.rahul.net> you write:
> Seriously, though...how can I get to the point where I can survive
>any encounters with fighting?

This is my favorite strategy for starting an AR: City character.
Warning: this is long! :-) There are some general AR comments at the
end.

First, decide whether you're going to be a good or evil character. A
good character is actually much, much easier to start with, because
you'll only get into half the fights and those greatsword-armed guards
won't attack you. If you want to be evil, try starting good and don't
start attacking good guys until you're strong enough to fight
guards. (The music tells you whether a creature is good or evil.)

At the character selection screen, keep your eyes on three stats:
strength, intelligence, and charm. If your eyes can't follow all
three, pick strength and either one of the others. I try to get a
strength of 18 or higher and at least one of the others above 16. This
will give you a reasonable chance of either charming or tricking weak
enemies, which gives you experience but keeps you out of fights.

Now you're at the Floating Gate. If it's raining when you start, get
inside and wait it out. (I prefer the tavern, since it has the best
music to entertain you.) Don't buy anything. Even if you can afford a
dagger, don't get it yet. Believe it or not, for a beginning character
(played this way, anyway), the greatest danger is from starvation and
dehydration, not death by violence. You start out facing north. The
sun rises in the east and sets in the west. Learn which mountains are
in which direction; it'll help until you get a compass and after your
compass is stolen. (The waterfall, for instance, is to the south.)

Find a cheap inn near a cheap tavern. If you don't start mapping right
away (I didn't), make sure you know how to get from the city square to
the inn. If it's midday and you're at max hit points, practice going
back and forth until you're sure you can find it. Make this inn
your base of operations. I like the Green Boar Inn (10 coppers to sleep
on the floor) which is near the Lost Tears Tavern (1 copper for a glass
of water, and 7 coppers or so for a bowl of gruel).

The Green Boar Inn is at 19N, 9E (starting at 0,0) and the Lost Tears
Tavern is at 12N,13E. To get there from the Floating Gate, head west,
past the smithy. Walk about halfway down the main street and there'll
be a door on your left. Walk past the door, take a left, and keep
working your way west and south until you see the inn. The tavern is
behind the inn in an area with a lot of freestanding squares; it's the

only square with doors. The Lost Tears Tavern also has the advantage of playing my favorite song in the game ("The waves at home are pounding on the shore..."). :-) If you get in an encounter on your first trip to the inn, run away!

Now you're ready to start building up your character. Plant yourself directly in front of the door to the inn and *stay there*. Wait patiently. Pick fights with muggers and only with muggers. Don't fight good guys; just ignore them. Run away from bad guys other than muggers. Be especially careful not to be hit by a mold or slime; if you catch a disease you're in trouble. If you can, try to charm or trick the muggers, depending on whether your charisma or intelligence is higher. This will keep you from getting hurt. But fight them if you have to. You can kill muggers with your bare hands; attack whenever you can, parry when you're low on hit points, and be careful of thrusting, since unless you kill the mugger you can take some serious damage in return.

When you're low on hit points, sleep at the inn. Try not to get too hungry or thirsty; this will slow down your rate of healing when you sleep. Starvation and dehydration are serious threats. When you're low on cash, only sleep on the floor and order the cheapest food and beverages you can. Don't wander around until you've got a weapon and a decent amount of hit points. Night falls at 18:00; this is the best time to be awake since the muggers are out but the seriously nasty monsters aren't. Staying out past 21:00 or so is dangerous for a low-level character. Try to avoid fighting when you're not very close to the inn. For the first few game-weeks, your character should lead as dull and unexciting a life as possible: inn to tavern to inn to tavern, maybe a trip to the bank, and back to the inn.

You should be able to get enough money from muggers to eke out a meager existence. When you get gems or jewels, head back to the bank in the city square during the day. Sell them. You might want to open a low-risk account and keep 50 coppers in there for when you're broke and starving. It's tempting to buy a dagger, but don't do it yet. Whenever you have 200 coppers or so, head back to the tavern and buy a round for the house. This is important! Once they get to know you, they'll feed you when you're hungry and poor. This is crucial in the beginning stages of the game. However, there's a bug that causes the game to lock up if you buy too many rounds for the house. Quit when the patrons in any given tavern say "Hip Hip Hooray!" You won't be able to afford that for a while though.

If you find weapons and armor, by all means use them, if you're reasonably sure they're not cursed. Potions, on the other hand, are dangerous. Don't drink one unless you're absolutely sure it's safe. Even with a strong well-developed character, I don't like to taste potions unless I'm near a healer.

Once you've got a weapon and have gained a few levels, start attacking other things. Keep in mind that charming and tricking--even when

performed on evil characters--are evil acts, so if you want to be a good guy start fighting with a weapon instead as soon as you can. Don't worry about it at first--it's either you or them.

Once you've got enough money to avoid starvation and instant death, get a compass. You'll need it for exploring. Then, start putting money in the bank. Not only does it earn interest, but it's safer than carrying it around. Remember, when you run away from something bigger and nastier than you, some of your stuff might get stolen. Even with a level 9 character, I never carried more than 2000 coppers around unless I was on my way to buy something expensive.

Needless to say, whenever you gain a level and when you first get a weapon, save your character and back up the disk.

By following these tips, within a few earth days you should have a character strong enough to start exploring the city. Hope this helps, and have fun!

****

Whew! Now for some random comments.

AR is without a doubt the best game I've ever played, of any type, on any platform. It's the only RPG that's ever really drawn me into the game. You really feel like you're a *part* of the AR universe instead of just controlling it from above. I remember thinking "hell, I've been sleeping on the floor for five weeks now; I think I'll splurge and get myself a nice room." You manage to settle into a real lifestyle. For me, it was up at 4:00 (don't want to waste daylight), breakfast at the Lost Tears Tavern, a day of exploring or running errands, dinner at any of various places, and off to bed at the Green Boar at 19:00 or 20:00. When I went to the dungeon, when I'd glance at my watch I'd think of what I'd be doing if I were in the city, and marvel that such an unpleasant part of the dungeon could be under such a nice section of the city.

I've given some thought as to what makes AR such a great game. Aside from the obvious stuff like the weather and the music, I think that the ability to make "cosmetic" choices gives the game that realistic feel. By deciding what to eat, what to wear, and in what sort of room to sleep, you inject your own personality into your character. Sure, you *could* get by just sleeping on the floor, eating gruel, and drinking water, but I'll bet nobody actually did, when you could have a room with a bath and some nice roast chicken with wine. Related to this are the varying menus of the taverns and selections of the shops. Details like these enhance the game immeasurably.

And all on a 48k machine, stored on a couple floppies! Yet today's multimegabyte monster games can't hold a candle to it.

I've played AR for hundreds of hours and owe Philip Price a tremendous debt of gratitude. I can't wait for his next game!

But, having said that, I have run across an annoying bug in the city. There are two squares in the southeast quarter of the city that you can get into but not leave. If you're mapping the city, you'll want to avoid them. They're at 6N,45E, entered from the east, and 6N,47E, entered from the west.

It *is* possible to survive with a good character. In fact, I think it's easier. It takes longer to become wealthy, but you get into a greatly reduced amount of fights. When I went into the dungeon, the Light Wizards' Guild accepted me immediately. (I went in late in the month of Final Reaping in year 1; this apparently gave me enough time to atone for my earlier sin of charming muggers.) My dreams were warm and bright, and the priest at the chapel said "thou hast achieved a level of great goodness." My first time at the chapel I was allowed into the sanctuary, and they gave me a spell and a kick-ass weapon which could easily do 90 points of damage in a single blow. Sadly, it was eventually sucked up by a devourer, which has got to be the nastiest monster ever devised. Makes your very blood run cold when you've got a lot of goodies and you run into one.

Now I just need to figure out the gargoyle's name. :-)

>So, if, in our case, 9600 baud is faster than you can read, that should be
>plenty fast enough for text applications. Unless, of course, I am missing
>something. :)

The point, was that it will slow down your transmission to its display speed, instead of what the serial port would be capable of. I've always captured text at the fastest possible speed, and read everything off-line. Additionally, I rarely edit source code text with the XEP-80, because of the slower speed. I'd rather live with the limits of 40 columns. Basically, the XEP80 is just a slow device. They could have transferred four bits at a time over the joystick port instead of just one, and/or used a faster baud rate, but they didn't.

I think we've gotten too nit-picky here. You originally questioned the level of support for another 80 column enhancement, on the basis that the XEP80 was not well supported. My point, is that the XEP80 is not a very exciting device, both in terms of what it provided, as well as the way in which it was provided. I think it is reasonable to hope for better support from a device that provides significantly better enhancements than what the XEP80 provided.

Source record: 89423

Yes! My girlfriend and I just finished upgrading our 800XL to SV 2.1!!!!
It works beautifully, and the video is crisp and clear.

I am getting the Yorky upgrade, which works with the 800X - that is
the reason for this upgrade. You see, I am used to the 130XE video when using
FT80. I tried out the 800XL with FT80, and was appalled! I could barely
read the words! So, I knew I would have to do the SV 2.1 upgrade if I ever
expected to make use of the Yorky.
Now, I am pretty poor when it comes to hardware stuff. I've friend
er, fried more than one Atari VCS and Intellivision while trying to fix
them. :(So, I was very reluctant to do this mod. But, it was necessary.
Enter my girlfriend, Carole. She, thankfully, is NOT thumb-fingered
with a soldering iron. She got the task started, and helped me by showing me
how to do things like soldering things neatly, keeping the solder from going
all over the darned place, etc.
We just completed the upgrade, reassembled it, and logged on here.
FT80 looks great, and everything is looking wonderful.
Thank you, Alchemist, for the great upgrade with instructions even
I could follow (well, with a little help[Grin]).

I'd like to also know this. But IMHO, an IDE(ATA) interface should be
much easier and cheaper. I have the ATA technical spec file, and although
I haven't read all of it, it strikes me that it should be very possible.

If anyone can disprove this idea, please do so and get it over with.
I know the Black Box does a LOT, but I think there is also a use for a
hard disk only interface that is cheap for all owners.

1856. Atari 1027 Printer: how to wreck the print roller

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: redwards@oanet.com
Message-ID: <redwards.6.0009D80F@oanet.com>
Source record: 89428

As I mentioned in an earlier post, I picked up an Atari 1027 printer in a Goodwill store. It was missing the ink roller. I was able to get the last ink roller at a local computer store. It was in a plain plastic bag and I was told that it had been reinked.

I put the 'new' ink roller in the printer and it worked perfectly. Three days later, I tried the printer again, and it jammed up. I have now disassembled the printer and the print roller is totally shot. The ink must have softened it in one place and when I used it, the print roller stretched, distorted and squashed in places. The roller will not turn as it has jumped some of the guides.

Is it normal practice to remove the ink roller after each use?

Does anyone know where I can get a replacement print roller?

What kind of ink should you use to reink the ink roller?

Thanks for any help,

Roger

1857. history question: new OSs for 800?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: psu01223@odin.cc.pdx.edu
Message-ID: <401pil$3bd@odin.cc.pdx.edu>
Source record: 89429

Thanks to everybody who helped me with the RAM boards in my 800. I realized I need an OS board as well. This is my first 800... I got into the Atari world more or less around the time of the 600XL/800XL introduction, so the 800 has always been kind of mysterious to me.

So, anyway, bear with my ignorance of early 8-bit history here... but learning that the OS comes on a board in the 800 started me wondering if anyone ever came up with replacement OSs for it.

I'm not much of a hardware guy, but wouldn't it be possible just to build a board full of EPROMS and thus upgrade the 800 to the XL OS or any other improved OS, maybe even the graphical, extensible one everyone's talking about now? And wouldn't stuff like the 1200XL IDE hack be easier when you could just put it on a board and pop it in instead of soldering a bunch of stuff onto an XL motherboard?

Am I just dreaming or is this worth thinking about?

1858. INSOMNIACS AUCTION LAST DAY

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: jrm8248@u.cc.utah.edu
Message-ID: <402t1u$et8@news.cc.utah.edu>
Source record: 89430

THE INSOMNIACS VIDEOGAME AUCTION!!!

HELP!!! I have so many video games, I cannot seem to sleep
at night. Please buy them now and save me from permanent
INSOMNIA!!!

This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

Remember to bid high and bid fast because if you don't, you
may miss your opportunity to own the games you really want.
And above all, remember to have fun!!!

Send Bids to jrm8248@u.cc.utah.edu

The rules to this auction are at the end of this message.

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Air-Sea-Battle, box is damaged $2.00 lgb

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $3.00 min

-Space War $3.00 ltravis

Atari 2600-LOOSE GAMES

-Adventure $4.00 grammaj

-Armor Ambush $1.50 lgb

-Basic Math: Atari, cx-2661

-Bowling: Atari

-Boxing: Activision $1.50 lgb

-Canyon Bomber: cx-2607 $2.00 ltravis

-Circus Atari: Atari $2.00 ltravis

-Chopper Command $1.00 mnathan

-Codebreaker

-Crystal Castles: Atari $5.00 lgb

-Defender: Atari $1.00 johnsose

-Demon Attack

-Enduro: Activision

-Flag Capture: Atari cx-2644 $1.00 johnsose

-Freeway: Activision $1.00 mnathan

-Ghostbusters: Activisin $3.00 ltravis

-Golf: cx-2634 $1.00 johnsose

-Gorf: CBS Video Games $2.00 johnsose

-Hangman: Atari

-Human Cannonball: Atari

-Ice Hockey: Activision $1.00 ltravis

-Joust: Atari $1.00 lestermi

-Kool-Aid Man: General Foods Corp. $5.00 ltravis

-Marine Wars: Konami $10.00 Bill

-Millipede: Atari $1.00 lestermi

-Night Driver: Atari $1.00 johnsose

-Outlaw: cx-2605 $1.00 johnsose

-Popeye: Parker Brothers $1.50 lgb

-Pitfall: Activision

-Q*bert: Parker Brothers $1.50 red5j

ATARI 7800-LOOSE GAMES

-One-On-One $2.50 lgb

-Pole Position II

COLECOVISION-LOOSE GAMES

-Carnival $3.00 lonadar

-Donkey Kong $2.00 lonador

-Donkey Kong Junior` $3.00 lonador

-Gorf $3.00 johnsose

-Ladybug $4.50 chrine

-Mouse Trap $2.50 TAR

-Rocky Super Action Boxing, may not work, case is damageed $1.00 rcolbert

-Smurf Rescue in Gargamels Castle $3.00 johnsose

ATARI 400/800-LOOSE GAMES

-Atariwriter Word Processor: RX8036 $1.00 rwjones

-Basic Computing Language: CXL4002

-Pac-Man: CXL 4022 $7.00 oscar

-Space Invaders: CXL4008 $8.00 oscar

-Star Raiders: CXL4011 $3.00 oscar

INTELLIVISION-LOOSE GAMES

-Advanced Dungeons &Dragons $1.00 johnsose

-Armor Battle

-B-17 Bomber $1.00 johnsose

-Burger Time $1.00 ltravis

-Carnival: Coleco

-Commando $7.00 ctdg39a

-Donkey Kong: Coleco

-Electric Company, label is damaged

-Frog Bog $1.00 johnsose

-NASL Soccer $2.00 rdubinsk

-Pitfall: Activision $1.00 ltravis

-Space Hawk $1.00 johnsose

-Space Spartans

-TRON Deadly Discs

-TRON Maze-A-Tron

-Utopia $1.00 TAR

INTELLIVISION-Box+Directions

-Armor Battle $2.00 johnsose

-SNAFU, box, no directions $1.00 TAR

-Sub Hunt, shrink wrapped: $3.00 johnsose

ODYSSEY2-loose games

-Alien Invaders-Plus, w/ box, w/ directions

-Alpine Skiing

-Blockout/Breakdown

-Computer Intro

-Hockey/Soccer

-Invaders From Hyperspace

-Ive Got Your Number

-K.C. Munchkin

-Math-A-Magic/Echo

-Speedway/Spinout/Cryptologic, w/ box, w/ directions

-Sub Chase/Armored Encounter

-UFO

SEGA MASTER SYSTEM

-Hang On/Safari Hunt

COMMODORE 64-Loose Cartridges

-Jupiter Lander $1.00 Doug

-Sea Wolf $1.00 lgb

TEXAS INSTRUMENTS 99/4A-Loose Cartridges

-Addition $1.00 perryda

-Addition and Subtraction 1 $1.00 ctgd39a

-Adventure

-Alien Addition $1.00 ctgd39a

-Alligator Mix $1.00 ctgd39a

-Alpiner $1.00 ctgd39a

-Beginning Grammar

-Blackjack and Poker

-Car Wars

-Computer Math Games II $2.00 marlin

-Connect Four $1.00 ctgd39a

-Division 1 $1.00 perryda

-Dragon Mix $3.00 min

-Early Reading $1.50 ctgd39a

-Early Learning Fun w/ directions

-Hangman

-Home Financial Decisions

-Household Budget Management $1.50 min

-Hunt The Wumpus

-Meteor Multiplication

-Moon Mine $2.00 marlin

-Multiplication 1

-Munchman

-Music Maker $2.00 marlin

-Number Magic $1.00 ctgd39a

-Parsec $1.50 min

-Pac-Man: Atari $2.00 riffraff

-Percents $1.00 perryda

-Personal Record Keeping

-Personal Report Generator $1.00 perryda

-Scholastic Spelling Level 3 $1.00 perryda

-Story Machine $1.00 marlin

-Super Demon Attack $2.00 aa441

-Terminal Emulator II w/box, directions $4.00 min

-The Attack

-Touch Typing Tutor

-Tunnels of Doom $1.00 ctgd39a

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for
thm, but I will not guarantee that I find them. Shipping
will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari Ultra Pong Doubles $4.00 johnsose

-Atari 2600 jr, no cables does work $4.00 zach

-Atari 2600 jr, no cables does not work $2.00 min

-Atari 2600 Paddle Controllers $3.50 mnathan

-Atari 800XL, no cables $8.00 JimT

-Atari 1200XL no cables $8.00 min

-Atari 1050 Disk Drive, no cables $8.00 JimT

-Colecovision, w power supply, joysticks $27.00 paladin

-Commodore 64 Computer, w/ power supply, in box $10.00 johnsose

-Commodore 1541 Disk Drive, w/ cables $11.00 zach

-Intellivoice for Intellivision Systems $6.00 min

-Odyssey2 in box with cables not working $1.00 lgb

-Texas Instruments 99/4A box + cables $10.00 min

-Texas Instruments 99/4A Speech Synthesizer $6.00 johnsose

ATARI 2600-excess

-Pac-Man
-Combat
-Asteroids
-Defender
-Missle Command
-Space Invaders
-E.T

Send all bids to: jrm8248@u.cc.utah.edu

HERE ARE THE RULES:

1. This auction is from Monday, July 31 until Sunday, August 6
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be INSOMNIAC BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $3.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated.

1859. Re: New 8bit OS

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZZIDyEv.lmcclure@delphi.com>
Source record: 89431

Regarding a new OS for the Atari 8-bits, I have finally succumbed and have to put in my 2 cents worth.

The primary reasons I see for a new OS for *any* machine are:

(1) To add new capabilities using existing hardware

(2) To take advantage of the capabilities of new hardware and make them easier to use.

So far, the only capabilities I have seen mentioned that would be added to a basic Atari 8-bit would be either multitasking or task-switching, and possibly a GUI. Considering a GUI would be difficult or impossible to integrate in a compatible manner with existing programs, this would mean entirely new programs would need to be written to take advantage of it. IMHO, this effort would be better used writing software that takes better advantage of new hardware. As to multitasking or task switching, this can be very useful, and can even be implemented with existing programs. However, to be effective, it almost certainly require something above a base setup.

Now, moving on to item #2, this is the one for the Atari 8-bit that makes more sense for me. Go for an entirely new OS that hungers for new hardware, and is ready to take advantage of it. Plan for hardware that does not even exist yet. If one wishes to run old programs, the old OS will still be there, but if the new OS is done right, users of expanded 8-bit systems will see how much more new programs written for this OS can do with their hardware. Users of unexpanded systems will see and hear of this as well, and want to expand their systems so that they can run this new OS and the new programs that come with it.

If you want a precedent for it, just peer into the Commodore 8-bit world. There, two operating systems dominate: GEOS, and the native Commodore OS (essentially, just BASIC and it's Kernal routines). While GEOS can run on an unexpanded system, it cries out for extra hardware (primarily a RAM expander). However, one flaw of GEOS is that it is not as easily extensible as a new OS should be. It is better at this than the native Commodore environment, but not as good as my next example:

OS-9. Perhaps the most extensible, flexible operating system ever created for an 8-bit CPU. For users of the Tandy Color Computer (especially the Color Computer 3), they have the freedom of the old DECB environment for older programs and simpler "hit the metal" programming, and OS-9 for programs that can work easily with new hardware, one a device driver for said piece of hardware is provided.

Another example is the Apple IIgs. On one hand, you have a machine that can act as little more than a slightly faster Apple IIe (under ProDOS-8). On the other hand, you have a machine that addresses new graphics modes, handles new hardware with greater ease, and addresses multiple megabytes of memory (GS/OS 6.01).

Frankly, I would advise holding up any new OS until a decent 80-column hardware is available to 8-bit owners. Build an OS with native support for 80 columns, support for various types of drive hardware (RAM, fixed and removable media, etc.), 65816 24-bit addressing, and installable drivers for various types of input (including not only mice, but a keyboard other than the standard one or something mimicking it), and you will have built something power users will not only want, but *need*.

Study how the operating system on ever other machine works, and take as many of their good points as possible: installable I/O device drivers from OS-9 and GS/OS, an interprocess language like ARexx on the Amiga that gives multitasking a true reason for being, and also like the Amiga, a dual personality that gives the user a choice of CLI or GUI.

Also, learn from the mistakes of other operating systems: The copy protection and refusal to divulge the info that would allow new versions of GEOS to be created are its biggest ball and chain. With GS/OS, Quickdraw could be rewritten to use new output devices, but try getting permission or a reasonable license from Apple to do so. Proprietary information can garner you more money if you are simply out for cash, but hinders the future. Since the Atari 8-bit market is not really a money-making operation, support the future. Any OS for the Atari 8-bit should be freely documented, with nothing kept "secret" to give the developer of the OS an advantage on the market. Releasing it as true PD would be the ultimate act of altruism, but stating in the copyright message that all rights are released after perhaps 3-5 years, and/or if the OS can no longer be obtained from the publisher would be the next best deal.

1860. Disk Emulator v9 soon available

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: classics@nacs.net
Message-ID: <401m6l$q1q@bab5.nacs.net>
Source record: 89432

Hi everyone, just wanted those of you interested in my SIO2PC disk emulator software to have an update.

Beta v9 will soon be available, extra features completed so far are:

1) Bugfixed for 1050 ED format/read/write. Now dos 2.5 compliant.
2) Happy high speed read support finished
3) More intuitive disk swapping (thanks for the suggestion!)
4) Happy high speed write support finished
5) Set Happy/Happy Status commands now supported. Seamless high speed booting of SuperDOS in SMART mode now possible.
6) Write protection of disk images now 100% functional
7) Command line options installed
8) 850 Interface RS232 coding started

Anyone interested in getting a new copy please e-mail me, im not sure if I will be uploading it to a FTP site anytime soon as many features are not 100% done yet.

Also, to finish RS232 support I will require a working 850 interface or P:R: connection. If someone is willing to loan me a 850/PR for a short time I would be very greatful!

Thanks everyone!

Steve

1861. FT-80 with SV 2.1

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <pJFAKqo.ransom22@delphi.com>
Source record: 89433

I'm having a strange problem. As I noted earlier, I did the Super
Video 2.1 upgrade. Now, however, when I run FT-80, I get little lines on
the side of my screen whenever a character is printed. they occur
along the right side of my screen. They appear to be placed randomly.
Even though I am typing on the bottom row of the text window, the spots are
showing up all up and down the right side. They are at the extreme right,
at the edge of my visible screen. They were never there before the SV 2.1
upgrade. They do not appear when using any other software.
Has anyone else had this happen to them?
Any ideas on what could be causing it?

-Joe

1862. Re: FT-80 with SV 2.1

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-06 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <hxKjqOv.ransom22@delphi.com>
Source record: 89434

Some additional info about this problem:

1) It does not happen in any other environment I have tried. From BASIC, every graphic mode has no problems.

2) It does not happen right away. Only after using the computer for about 15 minutes does this problem begin occuring. Could this mean a capacitor is the problem?

3) I am using an Atari 800XL that has been upgraded to SV 2.1. Otherwise, it is stock. I am using SpartaDOS X, R-Time-8, and Flickerterm.

4) Again, the problem does not seem to be related to keypresses. It occurs even when the online service is sending info, and when FT80 starts up and automatically sends macro #0 (the init string).

5) The little lines are about the size of a gr. 9 pixel.

6) The little lines appear just past the last column text can appear on.

7) While they randomly appear all over that spot on th right side, all up and down the screen only when there is new text coming on the screen, they appear whether there is new text coming or not on lines that have a character in the last column to the right. The lines flutter up and down that character (er, to the right of that character, and since they are one scanline high, they move around from the top of the character to the bottom of the character and points in-between).

Does that help?

Thank you in advance for any help/suggestions.

-Joe

A shop in the SF Bay area has two XMDs, used. I asked the sales guy how much & he said $10-$20 each. I didn't bother to check them out any further but if anybody is interested in these things I'll post the address.
IMO: XMD is a much better choice vs the 1027 if you need letter quality.
I have a 1027 I haven't used in years! It's probably suffering from the same problems you guys are talking about.
Rick

Wow! That is cool, an extremely common-sensical approach in fact.

This "ARx" stuff is new to me; and I've been using Atari since 1988. I've never seen the Mydos manual. It only appeared on a disk as working dos, and I took it from there. Then again, how many dos' are available;

- Mydos, MachDos, Blackdos, DOS XL, DoubleDos, Spartados, Dos 3, etc...
the list is pretty long.

As far as I can tell, Mydos is a good mix of all the features available, and it integrates them rather well.

1867. Norton Utilities on the 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-07 00:00:00 UTC
From: ai542@FreeNet.Carleton.CA
Message-ID: <DCyD1L.D0s@freenet.carleton.ca>
Source record: 89310

The MSDOS platforms have had Norton Utilities to pull them out of
potentially nasty situations, but I have not seen that type of utility
available for the Atari, other than a few that only support single density
and some that only work for Spartados disks.

Useful utilities that support single/double/enhanced for ALL dos types
could be:
- boot sector rebuilder (vvvv useful!).
- non-destructive formatter (like Norton Disktools revive disk).

One of the nastiest problems we have is where a protected original
software disk will not boot, or not boot consistently. Any ideas??

Vince

>to clarify the position.

Chris, I sincerely *doubt* that Atari released those ROMs into the Public
Domain. Correct me if I'm wrong, but didn't Activision have to re-write
the 2600 ROM (i.e., NOT emulate it) because Atari didn't give them
permission for the 2600 pack? If that's the case, I'd find it difficult to
believe that Atari would release the 8-bit OS into the Public Domain.
You're very right, check with Atari UK on that. %^)

>Sorry to all those who are finding the lack of ROMs a problem. I feel
>that including the ROMs, although nice, doesn't help Atari users much.
>He/she will still want to get their favourite software from the 8bit
>system to the Mac. The solution I proposed was the 850 unit. Other solutions
>may be possible e.g. via modem or adaption of the SIO2PC cable.

Or just go to atari.archive.umich.edu and download the files they've got
there. They can be imported into Rainbow and used -- assuming you've got a
DOS 2.0 or DOS 2.5 image to work with.

Just a thought...

Barry

>So, anyway, bear with my ignorance of early 8-bit history here... but
>learning that the OS comes on a board in the 800 started me wondering if
>anyone ever came up with replacement OSs for it.

I think there may have been some minor things. The Corvus hard drives
used a replacement OS that you plugged into a slot. There was an
80-column card or two, but I guess those don't count.
Doesn't the 800's OS board also have Atari's custom chips, such as
POKEY and GTIA? That might make replacing the board difficult.

There were also a few things that used the 800's right cartridge slot,
but those died out when everybody got XLs.

>I'm not much of a hardware guy, but wouldn't it be possible just to build
>a board full of EPROMS and thus upgrade the 800 to the XL OS or any other
>improved OS, maybe even the graphical, extensible one everyone's talking
>about now? And wouldn't stuff like the 1200XL IDE hack be easier when you
>could just put it on a board and pop it in instead of soldering a bunch of
>stuff onto an XL motherboard?

It might be possible, but the 800s aren't quite as common as the XLs
and XEs.

It would be much easier and cheaper to load a new OS into the XL/XE
"OS RAM" (the RAM that's under the OS) than to make a new board for
the 800.

Hello all!

Great to see such support for the Atari 8-bit. An 800 was my first computer, but I have since migrated to an ST, and now a 486. I stumbled across Xformer for the PC and it brought back so many memories that I want to get back into the 8-bit scene as much as possible. I have shoe-boxes full of software that I'd love to move over, but I'm having trouble with the modem and term software on the 800. The only thing I could find was 850 Express. Anyone know anything about it, or what I should be using instead?

The second and more important question is I don' have an un-arc program. Can someone point me to one?

I think that about covers it, unless someone wants to explain how to create an .xfd file for Xformer! Overwise I'll have to be content relaunching Xformer each time I want to change my application on the emulator.

Thanks in advance!!

Aaron

p.s. I will be going through all of my 8-bit stuff, which is a lot, now that my interest is peaked. I'll let you all know what I can live without. I know that I have a 520ST with 1 meg, color & mono monitors, floppy drive, and a hard drive controller card from ICD that I need to clear out of the closet. If anyone is interested I'll sell it along with about 200 floppies full of stuff for $375 plus shipping. I'm in the Bay Area of CA. Send me mail: aaron@caere.com

* off of six AK-47's
***************
```

Did you ever want to play those 8-bit Atari Carts in style, well the XE Game System is for you. It was Atari's last ditch effort to market their 8-bit computer technology for game use. It comes with a detachable keyboard (not normally needed for most cart games), and is the same kind of gray color as the Atari ST computer line. Quite nice looking and really compact. On the back it has the same drive cable slot of all the Atari 8-bit systems, a RF output for your TV, and composite and audio outs for a composite monitor. It comes with power supply, hard to find XE light gun and two high quality Wico joysticks. All for only $45 + $7 shipping. For $5 more add the following cart games: Centipede, Star Raiders, Defender, Missile Command and Joust. 30 day warranty included.

1875. Disk Emulator v9 soon available ** UPDATE **

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-07 00:00:00 UTC
From: classics@nacs.net
Message-ID: <405qns$61q@bab5.nacs.net>
Source record: 89318

: Hi everyone, just wanted those of you interested in my SIO2PC disk emulator
: software to have an update.
:
: Beta v9 will soon be available, extra features completed so far are:
:
: 1) Bugfixed for 1050 ED format/read/write. Now dos 2.5 compliant.
: 2) Happy high speed read support finished
: 3) More intuitive disk swapping (thanks for the suggestion!)
: 4) Happy high speed write support finished
: 5) Set Happy/Happy Status commands now supported. Seamless high speed booting
: of SuperDOS in SMART mode now possible.
: 6) Write protection of disk images now 100% functional
: 7) Command line options installed
: 8) 850 Interface RS232 coding started
:
: Anyone interested in getting a new copy please e-mail me, im not sure if
: I will be uploading it to a FTP site anytime soon as many features are
: not 100% done yet.
:
: Also, to finish RS232 support I will require a working 850 interface or
: P:R: connection. If someone is willing to loan me a 850/PR for a short
: time I would be very greatful!

I dont usually follow up my own posts, but I thought I would let everyone
know that ATARI 850 SERIAL EMULATON IS NOW COMPLETE!!

Thats right, if you own an SIO2PC cable you can now use your PC MODEM
on another COM port as a modem on your ATARI!!

The program is now 100% Atari 850 boot loader stage 1 compliant, includes
a custom programmed 6502 stage 2 loader and a complete R: handler that
is automatically downloaded and installed in stage 3.

I have sucessfully booted BOBTERM and will soon be testing flickerterm
and ice-t. Im confident all of these will work since the new handlers
are 850 compliant.

Anyway, thought you would be interested ;)

Steve

>
>What kind of ink should you use to reink the ink roller?
>
No, it's not normal practice to remove the roller. It's as I feared in my first messages to you: 1027 rollers are getting very old (as are 1027's). The rubber has apparently turned to moosh. There was another message yesterday about a possible source for rollers (that there was a Mannesman-Talley version of the printer). My only other suggestion is as before: see if any printing calculator rollers match.

Also, pay attention to what that other message said about the printhead--the rubber print elements may be turning to moosh too. I got a 1027 last year at Goodwill which jammed immediately on use. The print elements stripped right off and crumbled/mooshed in my fingers. I seriously doubt that there is any reasonable way to replace it. It may very well be that 1027s are reaching the very ends of there lives everywhere now.

Of course you realize that the 1027, aside from the curiosity of being "letter quality" (just try printing more than a couple of the same character in a row without a very fresh roller, though--it fades away, not getting well reinked fast enough), is just about the crummiest, noisiest, slowest, and all around most frustrating printer to work with. Unless you are a collector, find some-thing else for anything approaching serious work. The best thing they are good for is to remind us old timers what the ancient Model 33 Teletype hardcopy terminals sounded like when they were crunching away at 110 baud :)

This is true. And the IDE interface has been done. All that's left to do is the smart socket (sram) board for the OS, and Bob Wooley gas a working model on an 800XL. The board has a stock rom and the sram in a smart socket, switch selectable. You can read the OS into the socket from rom or disk, diddle it to your hearts content, then lock the socket and it holds the code (the socket has a battery.) Great for diddling new OS's or for implementing IDE code! Bob did say that a SCSI interface is a lot tougher, and he has researched it. And the IDE interface is pretty inexpensive.bjcorr@delphi.com

1891. Newell Ram Rod Board

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-07 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9508070306592.The_Win-D.bjcorr@delphi.com>
Source record: 89450

If anyone has a Newell Ram Rod board I could use some help. I think the 2 sets of switches on my board are messed up and I don't have the proper settings to restore them. I have Omnimon and Omniview as well as OSN6 on it, but any working configuration would be a start, just tell me what your swithc settings are and what you have on board.(This is for an Atari 800!) I have;

SW1
1 off
2 on
3 off
4 on
5 on
6 off
7 off
8 off

SW2
1 off
2 on
3 off
4 on

The computer comes up dead except for a verticle bar or 2 of light.
Hope I haven't lunched the board....

; Didn't someone recently post that they were working on an SIO2MAC
;connection? That would be the easiest and fastest way!

That would be very cool! :)

In the mean time I'm working on some new software to use with the 850
unit. Using this will mean you can copy a whole enhanced disk image over
to the Mac in about 5 minutes.

Should be ready before too long!

Chris Lam.

1897. FS Atari 8-bit computer set (cheap!)

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-08 00:00:00 UTC
From: brade@ksu.ksu.edu
Message-ID: <4071v5$3ou@nbc.ksu.ksu.edu>
Source record: 89319
Cross-posted to: rec.games.video.classic,rec.games.video.atari,comp.sys.atari.8bit

Hello,

I've got a whole bunch of Atari 8-bit stuff including some very good games
that I'd like to sell. The set includes:

Bill Budge's Pinball Construction Set
Archon (box & docs)
Knicker Bockers (docs)
Shamus (docs)
Frogger (docs)
David's Midnight Magic (box & docs)
Threshold (docs)
Stocks & Bonds (docs)
Choplifter (docs)
S.A.G.A #1 Adventureland & #2 Pirate Adventure (docs)
Seafox (docs)
Tail of Beta Lyrae (flakey)
Preppie (docs)
Enchanter
Astro Chase
Lode Runner
Ultima III & IV (boxes & docs)
Blue Max (box & docs)
Ali Baba & the Forty Thieves (box & docs)
Nightraiders (1/2 box) :)
Pac-Man (cart)
Basic (cart) w/docs & self-teaching manual
Atariwriter (cart) w/minimal docs

1 fully functional Atari 810 disk drive w/cables & power supply

1 semi-working 800XL. Note that I really don't know anything about
the XL series but it wouldn't run most of my games when my 800 would.
Seems to load carts fine & small disk games also work Threshold comes
to mind as one that works. Also includes working power supply.

Note that as far as I know (i.e. the last time I checked) all of the
disk based games worked fine except Tail of Beta Lyrae which seems
to be a bit flakey. Since I don't have a system to test them on I've
got to sell them as is w/no guarantee.

The price: $50 for the lost shipped to your door anywhere in the USA. No
overseas orders please! I accept money orders in advance or will do UPS
COD for an additional $5.

NOTE: NOTE: NOTE:

You will HAVE to a ATARI cable for the 850 to your Modem. The
standard IBM cable won't work! There are 3 signals rearranged, pins 1, 3
and 4 on the DB9 to 850 end.

Just a note to publicly thank several people in this group who offered me help in getting online with an Atari8. Specifically Vince (chair@pgh.nauticom.net), Ben Corr, Glenn Saunders, Rick Cortese, and *especially* Tom Drake and Bill Kendrick. I haven't gotten it all together yet, but soon I expect to have email connection with our son who is 2500 miles away. And I imagine you'll have a new member. Again, thanks to all! It's much appreciated.

Alan

I recently purchased a copy of Star Raiders for the Atari 800... it's been a long time since I last played it, and since the game came without instructions, I'm having a tough time remembering how to play the darn thing.

Does anyone have the instructions (or a section thereof) for this game in electronic form?

Thanks,

Brad - unless the XL is broken, it should load 99% of the software that
the Atari 800 can load, IF you hold down "OPTION" as you turn on the XL.
(Otherwise it's like bootup up a game on the 800 but with the BASIC cart.
installed!)

>the Zip drive does not provide.

Unfortunately, it is not IOMEGA's fault. You're laying the blame on the
wrong company, if my SCSI knowledge isn't too rusty. On the SCSI spec, it
says that the host adapter should have the ability to provide TERMPOWER.
So the Adaptec MiniSCSI adapters should be providing termination
power, and not the Zip drive.

Now, Adaptec might be very limited and constrainted when they made those
parallel-to-SCSI adapters. There really isn't that much power to be drawn
from a single parallel port. So they sacrificed one thing (TERMPOWER) for
another (portability).

Someone correct me if I am wrong.

--Ed

They will work, however, if (still

Simply get a copy of Ice-T and/or FlickerTerm80 from the UMich archives.
Look for the FAQ to tell you how. Neither of them need special hardware
to give you 80 columns. Ice-T uses bitmapped graphics and goes up to ~9600bps.
FlickerTerm80 uses a flickering effect and two text screens (with small
fonts) and goes up to 14.4kbps.

If you can stand 1200bps, get the Atari SX212 direct-connect modem.
Or, get a used (or new if you can find 'em!) Atari 850 or ICD P:R:Connection
modem/printer interface.
Or, go all the way and get an MIO or BlackBox hard-drive/modem/printer
interfeace.

For terminals, get IceT or FlickerTerm80 for 80 column VT/ANSI support,
and BobTerm 1.22 for X-, X-1K- and Y- modem download/upload support.

> above a base setup.
>

I feel that, given the 6502's inherent limitations, it is NOT possible to
multitask EXISTING 8-bit applications. This is primarily because the
processor (excluding zero-page addressing, which is useless for this task)
simply can not handle indirect addressing and PC-relative LONG branches.
Furthermore, existing applications don't even TRY to fake indirect
addressing.

What does this mean? It means that you can't put these programs anywhere
in RAM. Even if you have an 8-bit with 1MB of memory, most of the
programs you run will expect to be in a certain place in memory and will
not function if they are loaded elsewhere. This means that you can not
have multiple programs in RAM, which, in turn, means you can't multitask
(and we all know that multitasking kind of depends on having multiple
programs loaded).

Now, it is certainly possible to load an existing program into RAM and INTERPRET the thing... but jeeeeezz, we're talking about a 1.76 MHz, 8-bit processor here. The program execution would be dog-slow at best (everything would run at BASIC program speeds).

HOWEVER, what if all of the programs running under the new OS were DESIGNED to offer indirect addressing and PC-relative branching capabilites? In this case you have a new OS running many compliant programs at once -- another way to put it is that you have "added new capabilities to the existing hardware." This satisifies your first point.

> Now, moving on to item #2, this is the one for the Atari 8-bit that makes

Any good OS provides for device-independent I/O. Even the limited OS built into a stock Atari 8-bit provides this capability and any new OS should extend these features.

> Study how the operating system on ever other machine works, and take as

This goes without saying for anyone designing an OS. However, don't look for many Amiga-like inspirations in my software (except those that were borrowed from other people, like interprocess communications, etc) ;-).

How about allowing old programs to use the lower 64-128k as usual,
while simultaneously running new programs in the >128k memory.
Then the old programs fight it out among themselves as usual, while
still allowing new "nice" programs to run.

I'm not sure about the OS requirements of this yet, but it's kinda
like what OS/2 and Win95 do with old (16-bit) programs in the PC
world.

k >what Easy-Scan is/does/can-do!
k >
k >Someone? :)
k >Thanx!

Howdy Bill

It looks like an old cartridge. With a (is that Allen or Philips?) screw
that holds a thin piece of sheet metal in place. (the computer doesn't
know if EasyScan is connected. On the top, two strands of fiberglass
are "screwed" to the cartridge. These strands are held together for the
most part. If the cartridge is connected to the computer, one of the
really long cables will show a bright red light (if you look into it).

The end farthest away from the cartridge is then somehow fixed to the
head of your printer. Since most printerheads are different, Innovative
Concepts never bothered to offer something to fix the wire to the printer
head. The fiberglass cable should be placed about 3mm (1/8 inch) from the
"paper".

You stick the picture you want to scan into the printer and let the program
run (after using the provided test sheet to configure EasyScan to your
printer.) It does take some time to scan in a picture.

The good thing about EasyScan is, that it can save 256 shades of grey.
Bad thing is, these file that up most, if not all, of your RAMdisk. You
need atleast 128kByte BTW.

I've bought one of these suckers when I.C. was still alive and kicking.
I even upgraded to version 2.0 of the software.

O ye' if you have a copy of ANTIC, the October 1988, Volume 7, number 6,
there is a picture of EasyScan on the cover (and a review inside)

r >some don't. (MAC SIMMs don't but they are pin compatible.) Also, a lot of C
r >manufactures are dropping Parity checking and are using just 32 bits per SIMM
r >Cheaper and the DRAMs are so much more reliable these days.

Let me check if I got that right.

A 256k SIMM with 72 pins would have just as much memory as a 1 Meg 30 pin
SIMM.

If yes, could one replace the other? (with some hardware changes ofcourse)

Which once is Mike Hohman of FTe gonna use?
(I guess that's a question for Mike)

k >swab. I'm no expert on cart cleaning, but DON'T use harsh abrasives!

Talkin' bout connectors. While trying to find the resistor that have to
be changed to make the KEYBOARD of my 800XE work, I saw that somebody
(probably me, cause nobody else even touches my classic Atari's) had been
a bit harsh on the keyboard connector. I mean the part that's attached (sp?)
to the keyboard mylar. I could see through part of the metal strips.

BLUSH

I "touched it up" with some "silver paint" used for scale models.

Hope it works, otherwise I'm gonna use the scissors. If I wiggle the mylar
all keys seem to work (this is before the "touch up"). Otherwise all kinds
of keys would stop working. Like sometimes T, G, B, I, K, and comma
wouldn't work and sometimes they were joined by W, S, X, Up-arrow and Down-
arrow. And START didn't/doesn't work either.

I could type BYE to get to the Self Test, START to start to test (when I got
there via booting with Option pressed while other hardware was attached.
Heck, even 1 ? PEEK (53279):GOTO 1 didn't work (no "K")
53279 is were you can read the status of Start/Select/Option.

r >least not to me.

Erhard Puetz (aka Atreju on IAN and USF-Net) sais it can handle higher speeds.
14k4 should be possible and even 19k2.

And he sais it CAN do color. Unfortunately he didn't prove this. He seems
to have little time. This is all mentioned in an article by Erhard that
was translated by me and I guess it was posted here too (by somebody else).

j >
j >Underlined - No
j >Blinking - No
j >Luminance - No
j >Fonts - Only between ATASCII graphics and Int'l characters.
j > Basically, matching the built-in fonts of the Atari.

OK it's 2:45 am whe I'm writing this. Here's a list of the things Erhard Puetz
sais the XEP80 will do. I'll try and find the original article (well,
actually my translation) and put it in another message.

Invers, Halve bright, Blinking, Double Height, Double Width, Underlined,
Hidden, Graphics. The XEP80 seems to have/use a 6551 or a chip that really
looks/feels like it. So 19k2 should be possible. Erhard even mentions
something about 38k4 and him having to test this. But he has little spare
time, he's the floppy doctor for the ABBUC (= German 8bit Atari only user
group)

1927. GP1U52X

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-08 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <408jph$kr@link.xs4all.nl>
Source record: 89349

(I'll cc this copy to David Deaven and to c.s.a.8)

Howdy David

Thanks to James King I now have one GP1U52X IR detector module.

Unfortunately, the three pins on the metal box are not numbered/named.
This is what this thingy lookes like. For those who've never seen a
Sharp GP1U52X. in reality it's about as big as a sugar cube.

- - - are tabs on the housing

o are pins
o
o
o
-

I know they are 5 Volt, Ground and TTL, but which is which?

BTW I thought a had a piece of perf board lieing around somewhere, but...
question is, where?

So I soldered up the thing (except the GP1U52X ofcourse)

I guess it's normal that the LED goes ON if the file isn't running.
In parallel with 1 IR LED (just for now) I soldered 1 red LED (incl. one
150 Ohm resistor per LED). I used the red LED to check if the thing is
working. Still have to find out if it works.
If it does, I'll put it in a nice little box, and probably even add more
LED's. Hey, would this thing work if we hooked up a second IR detector
module and/or even a second 555? 555 on pin 2, IR det. on pin 4 (conf.
for input)

>problemns.

Hmm... It would be nice to have something a bit better than that for disk
use..1 meg segments??.. well, of course i'm ignorant of the technical
aspects of the design. There isn't much code to it is there! <G>

>The code to run the drive requires;
>1) A slight modification to the OS to tell the OS to JSR to the IDE code if
>the drive selected is drive 2 (the IDE drive number, this too can be
>changed.) Only 3 bytes at $9C5B, but still in the OS area. At the moment I am
>running the OS out of ram to do this. But there are other options..... 2) A

Hmm... $9C5B is in the middle of CART.B slot. ($8000-9FFF) Why is it
floating around there? There's other pockets (if you want to burn eproms)
in the OS to store 256 bytes or more... I distinctly remember a 4K region
that was mentioned in Mapping that was rumored to be used for 3D-FP routines
from Atari. It never saw ROM tho..

>there (again in the OS area.) Hmmmm..... And you lose half the drive
>capacity due to the 8-bits 8 byte data bus.

There shouldn't be anything wrong with the 8bit data bus. IDE drives
(as per the spec) are supposed to transfer either 16-bit or 8-bit at a time.
This is read off the controller storage ram/cache. The problem I guess
is that the Atari doesn't handle 512-byte sectors in most DOS's. Right?

How about this ;

Partition (if you must) a 'disk' on the drive. Say, 1 Megabyte size.
This partition consists of 2048 512-byte sectors. The atari reads the
first 256 byte for most usage. This gives you only half actual disk
storage to use. Yuk! BUT, it's better than no HD at all. Right! :+)
Make the DOS/Driver believe there are twice as many sectors (blocks)

in the partition as there really are. So 1Meg is treated as 4096 sectors
on the Atari side. It reads the first 2048 H.D. sectors normally.
When it starts to access sector 2049, it goes back to the start of the
partition and reads in the Last 256 bytes of the sector. Remember the
whole 512byte sector is stored in the drive ram, you only need to make
a way of properly handling it. And that only requires software!
It then works normally reading the latter half of the sectors on the HD
treating them as sectors 2049-4096 in the example. You now have a Full
1 Meg HD partition to use. Or more if you use a larger partition.
So I wouldn't burn any EPROM's yet folks... hopefuly this can happen!

>The best solutions are to;
>1) Burn a new rom. The modifications required should not pose any threat to
>exsisting software (I could be full of it here, especially in regards to the
>3 bytes at $9C5B! Anyone?) 2) Bob's soultion is to install a smart socket and
>put the OS in there. Locking the smart socket after reading in the OS and any

>in 3 locations and I don't yet know how to get THAT into a binary file.
>HELP!!!!) The total cost of the project is less than $10, probably less than

Reset the loader pointer in the code. It should assemble it so it reads
in the bytes right where you want them. The MAC/65 is easiest for this..

>$5, but needs careful attention (I blew it many times, I speak from

RIGHT ON!! Which chips are used? I have a ton of miscellaneous chips
here from one mid-80's minicomputer that is just sitting there as parts!!

>I did have problemns with my first drive, Kalock KL 3120. Don't know why.

Hmm.. Well, it seems some IDE drives are just a bit weirdo sometimes.

>Nearest I can guess at, the interface floats the IOR and IOW lines at boot
>up, but the voltage was high enough to fool the Kalock into thinking that the
>lines were high, and it has a seizure. Weird.

Tolerances might need a bit of tweening. Can that board be simulated on
a PC to make sure it will Work As Directed ?

>Oh well, that's it so far. When the smart socket get's done I'll let you all
>know. Anybody want to burn a ROM or two for me????
>
>bjcorr@delphi.com

I wish I knew about this all earlier... What other kinds of cool projects
are being worked on?! Can someone tell us ? I know Vapourware is

a danger tho, but if the project is making head-way, then please tell us!

This IDE interface is just excellent!!! How long was it in development?

I remember the ranting over the "Self Test" thingie which replaced the even more useless Scratchpad.

The Translator disks worked pretty well. We used TextWizard on a kludged 400 and 800. It didn't run
on a 800XL by itself, but worked just fine w/ the Translation.

You can occasionally find the old Assembler/Editor carts at yardsales, but good luck finding the
docs....

What about the computer itself? My first 600XL computer had a problem
which at times had unpredictable influence on the logic of certain
games. As far as I can remember, Datasoft's "Bruce Lee" and Synapse
software's "Pharaoh's Curse" did not work well. The "Bruce Lee" game
could not be loaded, and the tiny adventurer in "Pharaoh's Curse" ran
off in an unexpected direction. The games worked fine on an 800XL that
a friend of mine owned.

: installed!)

: -bill!

Err, actually a good chunch of the original software didn't work on the
XL. But to fix that, all you need is to run a program called
"Translator." It will make the XL pretend it is an 800. That will solve
all the problems.

I'd offer it to him, but since he is selling it then it is too late. But
if anyone else wants it...

Later!

```
The following is a text version of the
"Unofficial Atari 8-bit New User, Emulator Help FAQ" version 0.9.

It is converted from HTML (which is what the FAQ is now formatted with
(it was previously 100% preformatted 80 column text)) using Lynx 2.3.

The entire FAQ is linear, so this is all of it, right here in this file!

To view the HTML version, point your browser to:

http://zippy.sonoma.edu/~kendrick/nbs

And note, the filename of this document will be changing very soon...

Welcome to:

THE UNOFFICIAL ATARI 8-BIT NEW USER, EMULATOR HELP FAQ

Revision 0.9, August 8, 1995

By Bill Kendrick

---------------------------------------------------------------------

[ Differences from Rev.0.8: Added the missing list ending tags and
some active links (still trying to make it newdex-friendly! [frown!] ]
[ Differences from Rev.0.7: (Weakly) Converted to HTML! ]
[ Differences from Rev.0.5: Corrected descriptions of Atari computers;
Corrected PC Xformer 3.0 dealer list; listed where Mule and Util can
be found]

---------------------------------------------------------------------

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
[ not done ]
Finally, you can always ask Michael for a copy at
mcurrent@carleton.edu
---------------------------------------------------------------------

Summary of Atari 8-bit's and emulated 8-bit Atari's:
```

* Real Ataris: Atari 8-bit computers were produced between 1979 and 1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.0 and 2.5x. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
o PC Xformer 3.0x. Supports all OSes, 320K RAM, player/missile collision detection (which MANY games use!)
+ On Apple Macintoshes:
o Rainbow
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and 40 x 12 x 128-multi-colored-character screen modes are available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).

* Fine scrolling (both vertical and horizontal) can be enabled on
any line on the screen.
* All other screen attributes (color, player/missile horizontal
position, screen width, player/missile/playfield priority, etc.)
can be ajusted at any point down the screen via a "Display List
Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and
four 2-bit wide, 128 or 256 byte high single color missiles are
available. A mode to combine the 4 missiles into a 5th 8-bit wide
player is also available, as is a mode to XOR colors or blacken
out colors when players overlap (good for making three colors out
of two players!) Players and missiles have adjustable priority and
collision detection (which is not supported by the PC Xformer 2.0
and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3
and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit
volume-only modes can be enabled for digitally sampled sound
replay.
* A fifth "voice" is produced by the internal speaker on Atari
400/800's (for keyclick and buzzer) and in the XL's and XE's this
was (fortunately!) rerouted through the normal audio output, and
the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double
the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the
XF2-based questions which did not pertain to them, or to the really
dumb questions which were in fact understandable to new or rusty Atari
8-bit users, but had just gotten on the nerves of some of the
comp.sys.atari.8bit readers/digest subscribers.

This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the
job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN'
MANUAL) and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits [grin]).

It will also direct people who are unaware of the large amount of
Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps

become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

Since revision 0.7 of this file, Rainbow, an Atari 8-bit emulator for Macintoshes, and "6502", an Atari 8-bit emulator for Unix, have been released, and a 4.0 version of PC Xformer has been announced (and will require Windows 95).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.

2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.

3. How do I turn off BASIC?

To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!

See "Why doesn't this program load?", above.
5. How do I exit XF and return to DOS?

Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).
7. How do I use MSDOS files with XFormer?

Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image). Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.

Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).
9. What's SIO2PC?

Refer to the XFormer and SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced Atari 8-bit users).
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to "dir i:*.*")
+ [A] Disk directory (like "dir " and optional output destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one place or disk to another, just "[source]" copies from one place on one disk in a drive to the same place on another disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted first) (add ">*.*" or ":*.*" after a subdirectory name to delete the files within it. A subdirectory name alone will delete the subdirectory (if it is empty and unlocked)). (Acts like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but be careful). (like "ren [old] [new]" in MSDOS - with MyDOS, use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending (like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which boots with the current version of MyDOS you are using and also has the menu file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a

quick-format of an already-formatted disk (ie, just a very
fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot
sector, when using XFormer, it's much quicker to just copy
one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it
binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like
"[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ",
etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is
"E477", reset is "E474" (these are the hex values of the
addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from
BASIC, for example) it will write what is in memory to a file
"MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost
forever. When you exit DUP.SYS with the "B: Run Cartridge"
command, MEM.SAV is reloaded and the environment should be as
it was when you left. It's probably quicker to simply "SAVE"
your programs (if in a language) which aren't nearly as big
as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly
for advanced users or special setups. See the MyDOS docs for
details.
+ [P] Set density. Forces a drive to be recognized at a certain
density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in
SpartaDOS) This makes "D:" now the same as a subdirectory or
other drive. ie, "D2:" will make all calls to "D:" act as
though they are to "D2:" instead. Some programs when
prompting for filenames do not add "D:" to the beginning if
one is not present, they add "D1:". If you don't trust a
program to look to "D:" instead of "D1:" and you want it to
look to some place OTHER than "D1:" (ie, where "D:" is
pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s
if they aren't in the filenames you give and may give errors
(138, for example: device not present, ie, if you said
"TESTFILE.DAT" it may think you want "T:" instead of
"D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify
is on, writes will be slower but 100% reliable. With it off,
writes will be much faster but possibly not as reliable (on
bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are
identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some
densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk, you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination

so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.

Here's a comparison to using subdirectories on different DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you

wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using
"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line into the current program.
* Entering a line number alone will remove that line from the current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename (see below). To load and run a program, use the "RUN" command followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional destination device ("D:file.lst", "P:"rinter) and an option start and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
* For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text
* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics
include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)
* DRAWTO x,y - draw a line from cursor location (set with
"POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command
colors:
* COLOR 0 will draw using the background color, set with SETCOLOR
4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd
into memory locations 704, 705, 706 and 707 (the player/missle
graphics color locations). Examples of this will be presented in the
BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)

* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT
[CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^

Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters!
[grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.

* When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape
character appear, then type [ESC] then the edit key and the
character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you
typed as two [ESC]'s) will make the editor SHOW the following
character (even if it is an edit character), then the character
which you entered (with [ESC] and then the edit key) will make

that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.

* To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also variations on these are available in most other Atari languages!):

* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary mode 'c'. Channel 'a' must be free or else a 'Channel already open' (129) error will occur. To explain the different "modes", here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"

Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'
* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores the numeric value of
it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed types are
of course allowed).
* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks.
Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up on
your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at
UMICH). Connect your IBM to your Atari, load SIO2PC, and then run
the program FILE2PC on the Atari to transfer files to the IBM's
hard drive. Or instead create a disk image within SIO2PC and copy
files from one disk (a real Atari floppy) to another (the SIO2PC
image) with the Atari or MyDOS "C"opy command. If you want to
extract files out of the SIO2PC disk image file and store them on
your IBM's hard drive or floppies as single files, either again
use FILE2PC or use S2PC, an IBM program which can extract files
from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to
download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive! [cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and not "ATR"? To keep people from getting confused with the ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR" which works on PC's (a PC executable version comes in the archive) and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

* PC Xformer 2.0 and 2.5 can be downloaded via FTP from:
+ "ftp.clark.net":
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)
+ "atari.archive.umich.edu" FTP site:

1938. Cable for Atari Portfolio <-> PC parallel connection?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-09 00:00:00 UTC
From: Jacek Olszewski <jacek>
Message-ID: <409gqj$920@mirv.unsw.edu.au>
Source record: 89260

Does anybody know how to make a cable for data transfers between
portfolio and a pc using their parallel ports? Pin layout?

The manual of the portfolio parallel connection says 'cable with a 25
pin D-type male connector on each end, or an adaptor to a(?) convert
Centronics to 25 D-type connector' ((?) is mine) for file transfer.
I know that there are more than one possible parallel connections
(unlike for serial connections), depending on software.

I tried to ring Atari Computers here in Sydney, but they seem to have
vanished into thin air.

I the Following software for sale as a bundle...Thousands of dollars worth
of games!

Night Mission Pinball
Davids Midnight Magic (pinball)
Zork I
Zork II
Zork III
Ultima I
Ultima II
Exodus Ultima III
Ultima IV
Alternate Reality
Seven Cities of Gold
Murder on the Zinderneuf
Enchanter
Infidel
Starcross
Planetfall
Witness
Deadline
HomePak
Microprose F-15 strike Eagle (also commodor compatible)
GPX Data Base/Report System
Antic Draw IT.

All are orginal disks with all documentations! I will wait for two weeks upon this
post and take the best offer.... I want to sell it all at one time...Fell free to
sell it separtly to other parties i just don't want to have the trouble of tring to sell
them separtly...just make a bid and i'll take the best offer..thankx

No dream. I ran an alternate OS for years in my 800, OSN6 from Newell and loved it (till I trashed my Ramrod OS board.) In one 800 right now I have an Integrator board, a modified OS board that gives easy access to my Corvus HD. I believe Super puts out an OS that mimics the XL oOS for the 800. The IDE drive can indeed be run on an 800 with a modified OS. And you are right, pulling a board beats gutting the computer to diddle the OS anyday. And the 800 had the best unmodified video (and 2nd best keyboard) of any of the 8-bits. However, the 1200 has one thing the 800 does not, ROOM! Yank the PS out of the 1200 and the RF modulator and you have living room like space in there for other circuit oards to be piggybacked, room for HD's and even 3.5" floppies, etc. Piggyback the IDE interface on an 800 OS board and it won't go back in! bjcorr@delphi.com

Now, HERE'S a spooky twist. I've been told that the 5200 software, for
the most part, is a near-exact port of the 8-bit computer software.
Well, I have a Moon Patrol and three 5200 consoles -- two four-port (one
buggy), one two-port. The results are:

* four-port (good) -- it plays fine.
* two-port (good) -- it gets past the opening theme, then locks up when
buggy begins to move. No other games give me any problems on
that particular console.
* four-port (buggy) -- the buggy HOPS UP AND DOWN, FIRING CONTINUOUSLY,
much like the above symptoms.

This may or may not be a controller problem, though, as we all know how
much fun the 5200 sticks are to keep in working condition.

jeff. who thought it was a demo mode at first...

I've been having a similar problem with a 64K 600XL running Fight Night.
(The joystick button fires randomly). Swapped out all the chips and it
still happens. Works fine on my 800 and my 800XL. No other software has
this problem.

It could also be a hardware incompatibility problem, but I doubt it. I
only know of the 1200XL having such problems. (CBS K-Razy Shootout
freaks out when you run it on a 1200XL because the joystick port doesn't
work the same as a regular 400/800 and it's probably bypassing the OS.)

Sounds like one of the 4051 (?) CMOS chips to select the keypad/fire
buttons is zapped. I had to fix a CX5200P (4-port with VCS adapter
support) board that had that problem. (I had to because those are a damn
lot rarer than regular four ports!)

See the Colecovision FAQ for info on desoldering chips.

1948. New section, Atari 8-Bit Homepage

Source record: 89271

I would like information on how to do the SV 2.1 mod and if it is worth doing to my 600XL & 800XL.

I would also like to know what I need to do to upgrade my 600XL's memory.

What is the Sweet 16 upgrade? Should I do it and if so where do I find out how to do it!

I also read on this newsgroup about an IDE hard drive mod. I would like to know how to do that one as well.

I'm currently making a SIO2PC cable. Does anyone know if I'm using the latest schematic? I got it from Umich/sio2pc. I picked up sio319i.exe but it did not have instructions for making the cable. Then I got sio2pc38.exe and it had three ASCII files with info on how to build the 'one chip' version of the cable. Before I get too far, is this the right cable to be making???

Thanks in advance for any and all info.

Please email me at hutch@ena-east.ericsson.se
and post to this newsgroup so others can read. I've read about all of these mods but did'nt see away of getting any further info on how to do them and what was needed.

Michael, you're talking about multitasking with existing hardware only right. I'm not really a proponent of multitasking anyway, just erased OS II Warp off my clone's HD & it REALLY felt good! *But* your comments got me thinking. Ever program in ASM on a clone? The way they access the full memory is to have a regular 64k program counter along with a register that provides an offset into a 64k segment. Your concerns about things like page zero usage are real & almost insurmountable when you consider the amount of stuff that has to be saved before you switch applications. It may be possible on something like a 256k+ XL/XE to do something like add the same functionality as the 80XXX series to the 6502. Just have the address be the result of a the real address comming out of the 6502+offset. For example, 16 bits of latch comming off a a second PIA chip being added with the processors address lines using CMOS 4008 4 bit adder chips. Or maybe just switch the lower 48k in & out with a latch vs 16k banks.

I am looking for the following games for the Atari 8-bit computers:

A.E. Air Support
Attack on EP-CYG-4 Barnyard Blaster
Blade of Blackpool Bounty Bob Strikes Back
Candy Factory Captain Beeble
Chicken Commando
Countdown Crime Busters
Crisis Mountain
Crosscheck Dallas Quest, The
Dark Chambers Desert Falcon
Diggerbonk Dodge Racer
Excalibur
Floyd of the Jungle Gato
Getaway Ghost Encounters
Grog's Revenge Gruds in Space
Guardian of the Gorn Into the Eagles Nest
Jeepers Creepers Kid Grid
Laser Gates Load Runner's Rescue
MidiMaze
Moon Shuttle Mr. Do's Castle
Phantasie Phantasie II
Pie Man Powerstar
Prisoner II Puzzle Panic
Quasi-moto Reptilian
Repton
Scraper Caper Sea Chase
Skywriter
Slam Ball Space Shuttle
Spare Change Star Trek
Stone of Sisyphus
Survivor Threshold
Thunder Fox Track and Field
Wing War Winter Games
Xenophobe

I am also interested in most cartridges. Let me know what you have.
Finally, I am looking for file versions of 5200 games that run on the Atari computers (primarily the games that were never released for the 8-bits, but also duplicates if they are programmed better).

The IDE (not EIDE or ATA-2) is pretty simple, a couple 16 bit registers
and a lightweight command protocol to move sectors around. I imagine
a little SBC w/ a hardware UART and 20 or so bits of I/O could be the smarts.

IDE's tend to work with 512 byte sectors which kind of makes a mess if
you want to use the stock Atari DOS.

Brian, the SuperVideo mod crispens up the video and color of XLs. I've never seen it in action that I know of, but many people swear by it.

For upgrading your 600XL, there was some 64K upgrade available from Atari and I'm sure there are other ways to do it documented here and there. (Sorry for not being able to answer these first two questions very well :) I've no experience with them tho..)

Sweet16 is a simple chip/board thing you plug into your XL. You pull the 6502 (hopefully it's socketed - if so the mod takes about 5 mins tops) and plug in the Sweet16. $70 from Fine Tooned Engineering.

The IDE jobs out there include a mod to stick an internal 2-3" IDE into a 1200XL desgined by Bob Woolley, and a completely different, external mod which lets you connect IDEs (and I think they're a little more flexible when it comes to partition size) called "MIO II", also from Fine Tooned Engineering (but not yet released I believe).

I forget Bob Woolley's address, but FTe's is: ftooned@delphi.com

As for SIO2PC, yes 3.19 is the latest version, I believe, and the instructions in 3.18 is the latest instructions.. again, I'm PRETTY sure :) (I use 3.19 and am going to start using Steven Tucker's "Disk Emulator" when it starts working better (I've had trouble with some disk images) - BUT, I didn't build my cables.)

Also, there are other tweaked versions of the SIO2PC cable. I think the one I have is one.

I wouldn't even consider it. Remember, the 30 pin SIMM data path is
only 1 Byte (8 bits) wide. The 72 pin SIMM data path is 4 Bytes (32 Bits) wide.

> CU Mathy Van Nisselroy mathniss@link.xs4all.nl
>
>>>>

I'd better do a little update here. All of the newer SIMMs, be they 30 pin
or 72 pin, are at the slowest, 80 NSec access time. For the last few months I've been
working on upgrading a 256K MIO to 1 Meg using a single 1 Meg, 30 Pin SIMM. I
modified the change I made in 1989 which used 8 DIL 1Meg chips which is still working.
To make a long story short, I couldn't make it work with -70 or -80 NSec
SIMMs. Last night I popped in an old MAC 30 pin SIMM, a -100NSec one. It works!
Well, almost. It works as a RAMDISK, but hangs when I connect the SCSI Hard Disk
to it. This is another problem I'll have to work out. My original MIO I used 150 NSec
DILs.
The best explaination I can come up with is that the CAS and RAS signals
comming from the Atari XE or XL are too large and exceed the minimum pulse times. I
don't want to even think about trying to shorten them.
So if anyone is doing any upgrading of their XL or XE, DON'T get the faster
RAMs. 100 NSec max. It WON'T make you CPU run any faster, that is controled by

the main CLOCK. 150 NSec RAMs are just fine and even 200's will work without problems. Fact is I've pull many -200's out of XL's and XE's when upgrading them to 256K, 512K and 1 Meg.

From: mjewison@irus.rri.uwo.ca
Message-ID: <40abe2$gtc@falcon.ccs.uwo.ca>
Source record: 89280

Ben Corr Writes:

> If anyone has a Newell Ram Rod board I could use some help. I think
> the 2 sets of switches on my board are messed up and I don't have the
> proper settings to restore them. I have Omnimon and Omniview as well
> as OSN6 on it, but any working configuration would be a start, just
> tell me what your swithc settings are and what you have on board.(
> This is for an Atari 800!) I have;

[bad switch settings deleted...]

From my RAMROD MMOS manual (if it could be called that :-)

S1 settings: S2 settings:

Atari ROMs EPROMs (OSN6) 4&8K EPROMs 2K RAM/2K EPROM
1 on 1 off (OMNIMON)
2 off 2 on 1 off 1 on
3 on 3 off 2 on 2 off
4 off 4 on 3 off 3 on
5 off 5 on 4 on 4 off
6 on 6 off
7 off 7 on
8 on 8 off

I didn't actually check my machine, but I don't think I ever played around
with the settings.

Switch 1 is set depending on whether you are using OSN6 or the
original Atari ROMs in sockets Z6 & Z7. Switch 2 is set depending on
what you have in sockets Z9 & Z10. I also have the 8K OMNIMON and 4K
OMNIView chips in the 2 sockets so I used the 4/8K EPROM settings.
These sockets address the unused C000-CFFF bank in the 800. If you
run into some software which checks for OMNIMON before running, you
can always set all switches on S2 to OFF which will mask the ROM in Z9
from the system and allow the software to run. (The docs give
instructions on how to install a switch to disable this externally.)
As far as I can remember the only company to actually check for the
presense of OMNIMON was EA, but there may have been others.

If you don't have the documentation I could make a copy of what I've
got and send it to you. On the other hand, FTe might have some spare
(updated?) docs available for the RAMROD as a result of buying out
Newell. Who knows, he might even have some boards left. I can't
imagine a big demand on anything for the original 800 these days.

I like the idea of the RAMROD board. If you used 8K EPROMs instead of the stock 4K which came with the board, you could have two different operating systems available, accessible at the flick of a switch. I remember way back when I bough my RAMROD board (ca. 1986) I didn't know one end of a soldering iron (let alone an EPROM burner) from the other. I had lots of time to hack around with the machine but had no idea what I was doing. And of course, now that I've got a better idea of what I'm doing....

Sigh. Nostalgia can be a dangerous thing....

Source record: 89282

There is such an utility, unfortunately only for standard SD, ED, DD disks.
Its name is "Szperacz Dyskowy" (I have no idea whether english version exist)
and it supports both disk mode and file mode of working. Beside common
capabilities like sector(file) editing and string searching it gives you
few more e.g. changing files order in directory and on the disk
and speedisc like file sorting.

Edward, you know about the MIO2 (not yet released), don't you?
It's going to be an IDE HD interface for Atari's (with PBI's I'm guessing).

1963. Prisoner II game

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-09 00:00:00 UTC
From: Gil Parrish <73430.1546@CompuServe.COM>
Message-ID: <40b1or$iv7$1@mhade.production.compuserve.com>
Source record: 89285

In the fairly early days, a game was released for the Apple II, and possibly for the Atari, called something like "Prisoner II". It was modeled after that TV series, The Prisoner, and in it you were cast as the Prisoner while the program played mind games with you to try to get you to reveal the secret code you had been given. At one point, the program spins your disk drive, and threatens to format your game disk if you don't give up the code!

Anyway, anybody have a copy of the game, for any computer model? Just sounds interesting. Please respond e-mail; thanks!

The key words up there are "as usual". All I'm saying is that old
software would work just as before -- taking whatever memory they
want, without regard for anybody else. So yes, it's unlikely that two
old programs could run at the same time -- the same situation that
exists now.
But since old software only uses memory below 48k or 64k or 128k or
whatever, new software could use extra-high memory and follow rules to
get along with each other.

The OS doesn't need any more low RAM than the current OS. Why can't a
new OS use the 48k-64k space, then any higher RAM it needs?

Finally, the description of Drunk Tank

--drnktank.txt--
"Drunk Tank" megademo by Quasimodos, 1995.
For compy party held in Orneta Poland, August 1995.

One single density (Atari 810, 88K per side) bootable disk.
"drnktank.dcm"

1. a. Quasimodo logo/picture.
b. Drunk Tank logo.
c. 160 x 192 x 4 picture with large text drawn over it (credits).

2. a. 160 x 96 x 4 3D cube with images texture-mapped onto it:
Fuji, Happy Face, "Drunk Tank", names of the Quasimodos members.
b. Four sinus scrollers.
c. 160 x 96 x 4 3D vectors (each POINT of each line shaded depending
on depth!!!)

3. 160 x 192 x 4+ picture.

4. a. 3D manipulation of flat 160 x 96 x 4 images as well as some warping.
b. 3D 160 x 96 x 4 point-drawn sphere. (Sometimes you can see
"through" the blank space between points, sometimes not!)
c. 3D 160 x 192 x 4 starfield (first person point of view)

5. 160 x 192 x 4+ picture.

6. a. Multicolor scroller which is "stretched" vertically with sinus waves.
b. "Dancing" 320 x 192 x 2 circles.
c. "Castle Wolfenstein 3D" style hallway in 160 x 96 x 4 (not very good,
it only goes forward, it doesn't rotate in 3D any and is very slow).

7. 160 x 192 x 4+ picture.

8. Credits.

Michael,

I don't understand what you meant about the 6502 not having indirect addressing. Especially in the context of wanting to load programs anywhere in RAM. I would think relative addressing would be more useful for this purpose. (Though, the 6502 doesn't have it.)

I do think that the problem of loading programs into any area of RAM could be solved by creating a standard for a relocatable object file format, much like SDX supports. (Or even compatible with it). It does require updated development tools, but then both absolute and zero page addresses could simply be allocated to free areas. Operating systems for other computers work this way, and it removes the burden from the programmer of having to write special code to be relocatable.

>This goes without saying for anyone designing an OS. However, don't look
>for many Amiga-like inspirations in my software...

I don't understand this either. Everyone I know who has experienced the current Amiga OS as well as the OSes for other computers, considers the Amiga OS to be clearly the best. Inspirations from that direction would generally be a very good thing.

John Harris - jharris@cup.portal.com

Remember what you've written here and see below...

>
> The OS doesn't need any more low RAM than the current OS. Why can't a
> new OS use the 48k-64k space, then any higher RAM it needs?
> --

In order to have "old software in low RAM and new software in high RAM" as
you've suggested, you would need an OS to manage the system and put
programs here and there. BUT, you can't have an OS in low RAM AND have an
"old" program in low RAM too. You said yourself that the old software
would run in low RAM without regard to whatever else is going on -- I say
that this can't happen because in order for the program to get there in
the first place it would have to have been loaded by the OS, which is
itself in LOW RAM. See what I mean?

Now, if you're thinking that the current OS manages to coexist with other
applications, and you are wondering why a new OS couldn't do the same, the
answer is simple. The whole point of the new OS is to provide many new,
sophisticated capabilites. In order to do this the new OS will naturally
have to use more memory than the old one. Much more. This means that you
have MUCH less RAM left for programs in low memory -- put simply, they
wouldn't fit anyway.

I had a problem with my 800XL too...
on "QIX" when you closed an area,the "close sound" would play,
but the area would not be filled! It would randomly "hang" on this...
(from 4 sec to over 1 minute!!!) but still played o.k. otherwise
I thought this was a hardware problem(in the "fill" routine)
but I noticed that some disk games would hang when loading/accessing too...
All I did is "reseat" all the chips in the sockets!
They all clicked loudly when I did this..it works fine now!!!
TRY IT!

1970. 8-bit computer equipment -- FOR SALE/TRADE

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-10 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <40c6m4$sra@ixnews5.ix.netcom.com>
Source record: 89287
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy,comp.sys.ti

updated 08/10/95

I have the following 8-bit computer equipment for sale or trade. The list
includes systems from Atari, Commodore, Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been tested and
are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which
will be sent via U.S. Snail. The shipping cost depends on both the weight
of the package and the distance that it is traveling. The buyer has the
choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn
from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money
Order, payable in U.S. funds. This is the only way I have found to deal with
my friends to the north (my bank is very picky, but the U.S. Post Office will
cash a Canadian Postal M.O.)

* = (after price) Tentatively sold/traded. Inquiries welcome.

*****

LOT #1

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet,
so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and one (1)
Molex
connector cable.

$39.00

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

LOT #7

COMMODORE 64 COMPUTER with box, User's Guide (175 pgs.), power supply,
and
RCA cable.

I will also throw in a second non-working COMMODORE 64 for parts, FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #8

COMMODORE 1541 DISK DRIVE with power cord, and serial cable.

$25.00

*****

LOT #9

COMMODORE 1541 DISK DRIVE.

Power cord and serial cable are available from Radio Shack for around
$11.

$20.00

*****

LOT #10

RADIO SHACK COLOR COMPUTER with RCA cable, built-in power cord, and
built-in BASIC.

This is a complete system, except for RF switchbox.

$14.00

*****

LOT #11

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF
switchbox,
Beginner's BASIC (150 pgs.), one function key strip (for keyboard), and
four (4) cartridges [no boxes or manuals for cartridges]:

BEGINNING GRAMMAR
CAR WARS
MUNCH MAN
PARSEC

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to play.

$34.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video
game
systems and/or cartridges in trade towards any of these items. Systems
I

am interested in include, but are not limited to, the following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking
for now is software (primarily cartridge based).

Please send a list of what you have, and I'll let you know what I can
offer.
Please be specific, and indicate whether or not items (cartridges
and/or
systems) include the box and/or instruction manual. Please also
mention how
many, and what kind, of controllers are included.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

Nope, 16 bytes. Damn.

> This is read off the controller storage ram/cache. The problem I guess
> is that the Atari doesn't handle 512-byte sectors in most DOS's. Right?

You are absolutly correct

> 1 Meg HD partition to use. Or more if you use a larger partition.
> So I wouldn't burn any EPROM's yet folks... hopefuly this can happen!

Don't think so. The only way I can think of to access the lower 256 bytes of
each sector would be to latch them, in essence, you'd have to read each sector
twice. Once for the upper 256 bytes, move it onto the buss, then again for the
lower 256 bytes. Big slowdown there. But wait. With more logic you could treat
the lower 256 bytes of all the sectors as a second drive couldn't you? That
makes more sense I think. Come to think of it, Bob first thought of that I
believe...

> >The best solutions are to;
> >1) Burn a new rom. The modifications required should not pose any threat to

> >desire.
>
> Know if this will work across OS versions? B, C ?

Using a smart socket and SRAM you could implement the code anywhere there is
space in any OS, providing the code is relocatable (the current stuff is,
it's only about 256 bytes.)

> >Right now I have to run the drive with the Assembler/Editor Cart in , so I can

> This IDE interface is just excellent!!! How long was it in development?

Bob first started this hack in May of 1992. I found it and was suprised people
didn't jump all over it! Bob lives near me and so I became a pest about it and
he helped me get one running and it kind of got him playing with it again. Now
with the smart socket it seems a lot more viable than it once did, so I
thought I'd start giving progress reports. Maybe Bob will do an article on the
whole thing for Atari Classics? There are actually 4 hacks going on here:

1) For the 1200's you have to go to an 800XL OS. Easy
2) Building the Interface. Pretty easy.

3) Ripping out the old PS and putting in a nice beefy switching supply. Pretty easy. 4) The smart socket. Didn't look too bad, but I won't know till it's done and Bob writes it up so I can try to build one!

Just use a regular DB25 RS-232 cable and it should work fine.

1979. Need "4" Key for 800

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-10 00:00:00 UTC
From: pattons@holly.ACNS.ColoState.EDU
Message-ID: <40cel2$10li@holly.ACNS.ColoState.EDU>
Source record: 89296

I need a number 4 key for an Atari 800. Does anyone have a trashed out
800 that they would be willing to part with this particular keyboard key?

I just need the cap part, the underlying mechanism works fine.

Thanks,

Sam Patton

P.S. Finally returned to school... So, I am back to the net!

1980. software for sale

Here's some of the best classics for the Atari 8 bit. All have docs,
package unless otherwise noted. (Shipping not included for single item
purchases - in US will probably be $3)

Educational Software
++++++++++++++++++++
Elementary Biology APX $3
The Pond Sunburst Educ. $5
Note, the Pond is one of the best educational products for
developing logical thinking that I have seen. The other
really great educational program is Peanut Butter Panic
that teaches cooperation. (Unfortunately I don't have an
extra of that one to sell.)
Atari Logo Manuals-Ref & Intro Atari $3

Entertainment Software
++++++++++++++++++++++
Archon ECA,unopened $10
Pinball Construction ECA $10
The Seven Cities of Gold ECA,unopened $10
Hacker Activision $5
Seastalker Infocom,unopened $7
Conflict in Vietnam MicroProse $7
Zaxxon Datasoft $5
The Keys of Acheron,unopened (need Hellfire Warrior) $3
Slime Synapse,disk only $2
Trains Synapse, disk only $3

System Software
+++++++++++++++
DOS 2.5 Atari,disk & manual $3

Magazines
+++++++++ price for set
2 Analogs (4/86, 9/87) $1
4 Computes (7/86, 10/86, 11/86, 12/86) $1
8 AIM Magazines (ST & 8 Bit) (10/90, 11/90, 1-6/92) $3
9 Current Notes (ST & 8 bit) (6/89, 7-8/90, 9/90, 10/90, 11/90,
4/91, 5/91, 7-8/91, 9/91 $4

Let's Make a Deal!

rfunk@magnus.acs.ohio-state.edu (Rob Funk) wrote:

> How about allowing old programs to use the lower 64-128k as usual,
> while simultaneously running new programs in the >128k memory.
> Then the old programs fight it out among themselves as usual, while
> still allowing new "nice" programs to run.

There are two problems with this idea:
1) 8-bit software won't "fight it out". If application A wants $4000-$7FFF
for its own use, its just going to blindly use it. The same goes for
application B. The result is potentially disasterous program interaction
that would not only crash the conflicting programs but the reset of
OS as well. The only way to avoid this type of conflict is to interpret
the programs, and this (as I mentioned earlier) is very slow.

2) The OS ITSELF needs low RAM. In order to provide the enhanced
functionality I alluded to in my previous message, the OS needs to
have free reign of low memory. In short, the routines that "fake"
advanced CPU capabilities can not themselves "fake" these same
capabilities; this means they must reside in low memory.

I just thought of something:
If I understand correctly, the IDE interface is little more than a
PC's ISA bus extended across a 50-wire ribbon cable directly to the
drive.

So if we can interface an IDE drive to our Ataris, wouldn't it be
possible to connect a standard ISA slot (or a bunch of them), and use
things like internal modems?

From: tatar@student.uci.agh.edu.pl
Message-ID: <40dfq1$s87@galaxy.uci.agh.edu.pl>
Source record: 89300

In the days 4-6th of August we had second polish copy party for Atari
8bit users. It took place in the small town Orneta (near Olsztyn). As
usual there were some competitions:
* msx competition
* gfx competition
* intro competition
* demo competition

Results of the demo competition:
1. Overmind / Slight
2. Back to live / Taquart
3. Out of time / APC
4. Drunk tank / Quasimodos

I've got nearly all this stuff and I started uploading it to the Umich
archive. I don't know when will it appear in the Demos directory, though.

More detailed informations and all stuff I've got are also available from
the Big Atari 8bit Home Page. URL:
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/party2.html

Enjoy, bye!

> & out with a latch vs 16k banks.

I think you'll find that the overwhelming opinion regarding segmented memory is that it is a TERRIBLE idea. Consider the problems that plague IBMs:

1) Allocating RAM in chunks larger than 64K is very difficult

2) Programs which occupy more than 64K memory need to keep track of many house-keeping issues at 64K boundries.,

3) You end up with tiny, small, medium, large, and huge memory-models designed to explicitly deal with FAR vs.NEAR addressing and program management (i.e.calling a function in segment 400, at offset $8000 is different than calling a function in the same segment).

In fact, even Intel abondoned this bizarre addressing scheme when the 80386 was introduced. This is the fist of the 80x86 chips to offer PROTECTED MODE. This mode allows the chip to access memory using a single, 32-bit pointer. By doing away with the SEGMENT:OFFSET addressing scheme it became possible to allocate RAM without regard to the amount you are asking for, and it also became possible to address more than 1MB or RAM.

When it comes right down to it, we should all thank God that someday segmented memory will be an old wive's tale. ;-)

Incidently, my design does not run into the zero-page-swapping problem you mentioned, although I can see where you're coming from.

Thanks for the input...

-Michael Ellis

1985. Re: Easy Scan

Newsgroup: comp.sys.atari.8bit

Ben, the version you're talking about was slightly different. I believe it used something like a light bulb & a phototransistor to illuminate & capture the picture. I can't recall for sure, but I think it just hung on the joystick port. Easy Scan was done by Ian Chadwick of Mapping fame. He used two fiber optic 'threads', one to conduct the illumination, the other to get the reflected light back to the sensor. I'm not sure of all the stuff he put in the cart, obviously some form of ADC, but I definately got the impression it was more then just a few simple descrete parts.
Rick

Hey Tomasz! I got a few demos (Joyride, Drunk Tank, Out of Time, Back..some-
thing) from Tamas Bene..

I wrote up some desc's of what Joyride, Out of Time and Drunk Tank do and
was going to put them up with the actual files at Umich, but my FTP-
capabilities have been dead lately (nameserver is down on this system or
something..argh)

Here are the files though!

---joyride.txt---
"Joyride" megademo by Hard Software, Hungary, 1995.
For compy party held in Orneta Poland, August 1995.

Two enhanced density (Atari 1050, 127K per side) bootable disks.
"joyridea.dcm" and "joyrideb.dcm"

As with Hard's "Cool Emotions" demo, you may skip to any part of a demo
by holding OPTION+SHIFT+number during bootup, where "number" is the part
you want to get to.

Press most any key to skip to the next part (usually).

Side 1:

1. Joyride introduction containing sythi-digi music and great intro
pictures/logos.

2. a. Sinus-wave scroller (letters rotate as well as scroll up/down!)
b. Plot tunnel (like going through a water slide).

3. Plain colorful sinus-wave scroller with prerendered 3D raytraced
image of a juggler juggling three glass globes! (From the Amiga)
"behind" the scroller!

4. 3D landscape (hills/valleys) created with ploted dots.

5. Scroller text plotted onto spherical, circular, etc. 3D shapes!
(Some fish-eye lens effects, for example. 16 effects total!
Go to next effect with [SHIFT] or just wait a while.)

Side 2:

1. Hard Soft bios. 3D side-scrolling starfield on upper left corner,
scroller line in the middle, logo at the bottom. Images (in 16 shades)
of members on upper right corner with bio information to the left
(in 2 color high res!). Images morph from one member to the next!!!

2. a. Bouncing image (much taller than the screen) of all Hard members.
b. Interlaced multicolor plasma (control with [SELECT] and [OPTION]).

3. a. 16 shade fire effect.
b. High resolution multicolor(!) image of hands.
c. 16 shade images of faces which rotate 2-dimensionally and spiral!
d. Sinus plotter with filled circles for points.

4. a. VERY COOL 3D checkerboard layers! (each layer has solid colored
checkers and empty spots where you can see the layers underneath
it). They fly up at you. Needs to be seen to be believed!
b. Cool 4-color "laser" sinus plot show (previous frames fade away
giving a phosphorus effect)
c. Greetings (big text appearing on the screen to the fast-beat music).
d. "The End" screen with a movie-film line scroll of all of the
parts.
e. Credits.

Loader:
No simple blank screen loader. Not even just a countdown loader!
This plays great music and has a 3D high resolution animated display
between each part! AWESOME!

Uploaded to Umich by Bill Kendrick (kendrick@zippy.sonoma.edu)
Thanks to Tamas Bene of Hard Soft (ethtbe@duna.ericsson.se) for sending
the copy, and to Tomasz Tatar (tatar@student.uci.agh.edu.pl) for going to
the Orneta party because Hard Soft couldn't be there.

Oops :) Saved to abruptly.. here is the Out of Time description:

---outoftim.txt---
"Out of Time" megademo by APC, 1995.
For compy party held in Orneta Poland, August 1995.

One single density (Atari 810, 88K per side) bootable disk.
"outoftim.dcm"

Note: This is the incomplete version. The final will be out in a
few months (after the August party).

1. APC logo with "proudly", "presents", etc. The "proudly", etc.
text "morphs" from text into an image (3D vector pyramid,
ball-plotted sinus shapes, etc.!) and then back into text
and moves across and over the "APC" logo image!!!

2. 320 x 200 x 2 image of trees with a vector pyramid in the center.
A square then encompasses it and they both start rotating in 2D.
Finally, the entire image becomes a 3D vector cube with the
following images on each face:
1. Vector pyramid
2. APC logo
3. Starfield (3D side scrolling)
4. Starfield (3D depth (first person point of view))
5. Music "analyzer"
6. Sinus plotter
Also, the image is "solid" in that you can't see "through" any of
these faces!

3. "Tekkno" part with techno music and words flashing on the screen
as well as at one point a large 3D fence-like wireframe and some
"Spirograph" style drawn animated images.

4. Credits and information scroller.

Loader:
It boots with what looks like "Chaos Loader". You can get to any of
the above 4 parts by pressing [A] to [D] upon boot. Each part loads
the next part when it's done.

Description by Bill Kendrick (kendrick@zippy.sonoma.edu)
Thanks to Tamas Bene (ethtbe@duna.ericsson.de) for sending it to me.
Thanks to Tomasz Tatar (tatar@student.uci.agh.edu.pl) for sending it to Tamas.

There was an Activision game called "Hacker", where you went from large capital cities trading/bartering items to assemble a piece of paper with information about an outlaw company called "Magama, Ltd". A satellite scans for "unauthorized activity" and queries you (when found), on various parts of the subterranean robot unit (SRU). I keep on getting killed on the "security level 4" question; "Where is the test site". Does anyone remember??!!

I started playing the game again, when my son was using another computer, and I happened to pop this one in the drive - we never did figure this game out!

Heh, I don't have a good answer for that. Use the 800 versions of
those programs, I guess. :-/

There is an 800 version of Turbobasic. And at least SDX can be set
not to use OS RAM, although SD3.2 can't.

Hey guys - I don't buy into the idea that just because it's old it's worthless... this is a complete working system that has been well looked after and is an excellent midi sequencing system for someone just starting to record with midi. As far as finding a computereyes video digitizer for $10.00... I say that's fantastic, but it's worth a lot more when combined with the most recent software that works in graphics 9 grey scale. Anyone working with Rambrant will appreciate being able to import digitized images and work with the original AtariArtist drawing tablet which is well constructed, accurate, and infinitely better than those Koala pads that came out at the time. All in all I think I am asking a fair price... the Miditrack III software and hardware alone I purchased for a little over $600.00. Sequencer Software of this sophistication is expensive let alone a computer system to run it on!

1995. Copy Cartridge to Disk - how?

I seem to recall, ages ago, that there was a program to dump the contents of a cartridge into an executable disk file...does anyone know where I can get a copy of this program?

I vaguely remember this as well, but don't recall the
particulars. I hacked my StarRaiders cart with a switch so
I could just leave it in all the time, as I had no other
interesting carts.

Be forewarned that lots of cartridge software used (uses?)
the 'stomp myself' copy protection scheme, which is a no-op
in ROM but not in RAM...

If I'm not mistaken, the program you are referring to would allow you to
have multiple applications in memory and toggle between them. This is a
neat hack, but it is quite different from multitasking those same two
programs. In the first case you simply copy the programs in and out of
"active" memory on demand. In the latter, you are actually doing two
types of work at the same time.

From: kendrick@zippy.sonoma.edu
Message-ID: <40ga3j$9r8@nic-nac.CSU.net>
Source record: 89220

```
Ooooh... you don't wanna do it like that!
You want to do it either like this:

proc main()
char c

close(1)
open(1,"K:",4,0) ; want to read from keyboard

do
c=getd(1) ; get one char when one comes in (wait here)
until c='E or c='e od ; keep going unless they hit [E]

close(1)
return

or.. like this:

proc main()
char array cli(10) ; use a size or else it will overwrite stuff!!!

do
inputs(cli)
until scompare(cli,"E")=0 or scompare(cli,"e")=0 od
return

In the above case, it will only exit if the entire string is compose of
ONLY the letter "e" or "E"... "Exit" "eeee" "E!" etc will not work.

Also, if the user inputs more than 9 characters, the 10th+ characters
will start overwriting things.

That is part of your problem in your example. ("char array cli")

The other part is that you're comparing the address of the string ("cli")
with the address of the string "E" stored (literally) in your program!
Insane! :)

If you wanted to check for the 1st letter being "e" (so that "exit" OR
"e" would work), use this "until" like:

until cli(0)>=1 and (cli(1)='e or cli(1)='E) od

this checks to see if the string has any number of characters in it
(ie, at least 1). The length of an Action! (and Pascal) string is stored
in the very first ("number 0" or "zeroeth") cell of the character array.

It also of course sees if the first character ("oneth" cell) is an "e" or "E".
(note the single quotes.. they pretty much compile an "'E" into a "69").

```
Oooh.. Rob, you said do this:

char cli
...
InputC(Cli)

This reads in a card numerical value (0-65535) and stores it!
Not only is that wrong, but that won't even compile. :) The CORRECT
form of numeric (non-address-based) "Input()" routines is this:

number=InputC()

The way to read a single character is with the "Get()" routines, like
my example shows.

Actually, my first example can be shrunk down to this:

Proc Main()
char c

do
c=getd(0)
until c='E or c='e od
return

BUT.. since it's reading from channel 0, which is opened to the "E:"ditor,
not simply the "K:"eyboard, a Return or EOF will still be needed for
anything to be accepted.

I say go with my first example if you want single keypresses.
Go with my second/third examples if you want line input..

It's been a while since I've worked in Action, but I have a couple
ideas...
How does InputS know when the string has ended? Doesn't it wait for a
return or maybe end-of-file?

Try changing to a character:

proc main()
char cli

do
InputC(cli)

until cli='E or cli='e
od
return

```
Jeff;
Just a tip, no matter what the manual says, never leave an array
undimensioned. At least don't want your program to crash or want to
switch back & forth from the monitor to the editor anyway.
What's happening with your code:
Proc Main()
CHAR Array CLI($100); Best way is to dim
;Action! creates a variable that contains
;the address of a free block of $100 bytes
DO
InputS(CLI);Action! will pass the value of the
;variable to the the input string routine. Let's
;say the compiler when sorting through your code
;found the 1st free block at address 4423 decimal, that's
;what get's passed to the routine.
;The InputS() procedure stays there until it gets
;the RETURN key pressed
;When done, the first character of CLI will be the
;number of characters in the string followed by
;the string itself, i.e.
; 5HELLO
Until CLI="E" or CLI="e"
;OK, we've already established that CLI is equal to
;4423 ergo it will never equal 'E or 'e
OD

Besides, the "E" and the "e" in your example
are string arrays also! So let's say Action! found
the next few free bytes at 4802 & 4804 for the strings/
it becomes:
Until 4423=4802 or 4423=4804
which is a good way to set up a loop. What you probably
meant was
Until CLI(0)=1 and CLI(1)='E or CLI(1)='e
Keep at it though, as soon as you figure out the syntax it really becomes
natural.
```

As you anticipated, my answer to that is: We do now.

Ignoring for the moment applications that use the "OS RAM", current
programs run in "low RAM", and so does the current OS. They each have
their own part of that RAM.

>Now, if you're thinking that the current OS manages to coexist with other
>applications, and you are wondering why a new OS couldn't do the same, the
>answer is simple. The whole point of the new OS is to provide many new,

>have to use more memory than the old one. Much more. This means that you
>have MUCH less RAM left for programs in low memory -- put simply, they
>wouldn't fit anyway.

But the new OS can set the rules for using "high RAM". This includes
how it uses that memory. The OS only needs to be partly in the <64k
memory; it can call parts of itself that are stored in higher memory.

2008. Copy Carts? Ok, here's a way

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-11 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug11.231002.4953@wariat.UUCP>
Source record: 89230

A few people have asked how they can copy their carts to a disk file. Ok, here's an example of how I copied 'Math Encounters' by John Hsu. .

1.) COPY CART CODE TO DISK: Using Omnimon or BB monitor, break into the cart and copy $A000-$BFFF to disk sectors.

2.) FOLLOW THE CODE: (The heart of all efforts to defeat the terrible 'copy protection' problem.) Either use a program to write the sectors to a file or disassemble the sectors directly using 'Disk Wizard' or other disassembler. The init and start addresses of a cart are at the $BFFA area. Usually the init just points to a RTS. The start address is $BFFA. Follow the code and usually find where a byte is stored to the $A000-$BFFF (8k cart area.)

5.) FIND A SOLUTION: In 'Math Encounters', there were two places where an indirect store was used for a lot of things, one being putting a byte at $A7AE that caused a bad JSR (to the wrong place.) Since the indirect store was used for a lot of things, I didn't alter that. I just let the program go ahead and store a funky byte at $A7AE. Just before $A7AE, I put a JMP $640 to my fixup code, which simply duplicated the original code and ended with a JMP past the funky JSR address.

Now, this is over simplified. You have to make your load file move the Display List, screen memory and RAMTOP down first, before the disk file loads into the $A000-$BFFF area. There was a second indirect store in 'Math Encounters', dealt with similar to the first one.

For the 'power user', there's 'The Impersonator' and 'The Pill' which can copy most simple carts to a file, but you have to have some kind of dummy cart usually. And these disk files will no way run on emulators.

Then there are the Super Carts and banked carts. These require more advanced methods. I've seen 'Gato', a 128k cart copied, but it must have extended memory to run.

I only ever 'cracked' a few things. Many Atari8 programs are cracked into disk files, by far more able and patient people than myself. It is these cracked files that will eventually make up (if not already) the bulk of software that is left for A8, because the copy protected originals

will eventually fail (carts fail, disks get messed up, tapes
also.) And these 'cracked' files are the only commercial
programs that will run on emulators (maybe).

I have, somewhere in my boxes of stuff, a program called CARTCOPY.
It worked ok on older cartridges, where you had the basic cart in
the left slot and the source cart in the right slot. You also had to
stick something in the lid switch so the computer stayed on cuz you had
to insert the cart to copy _while_ the computer was on. Later on, the
newer cartridges always made the 800 crash, so I just assumed they did
something to the cartridge to discourage such forms of backup.

In other words, it may or may not work.

I have some memory maps and other info I collected during my Atari days.
If you like, I could snail-mail you a copy (sorry but I don't have one
on line, nor do I have a scanner).

As far as the assy programming goes, I started out by writing small assy
subroutines to do utility work in my basic programs, then took it from
there. Things like clearing a chunk of memory (great for quickly blanking
a section of screen memory), moving bytes from one place to another (i.e.
downloading the character set from ROM to RAM), buzzing the speaker, etc.

The doc that came with my 800 had info on calling assy routines using the
USR function, but I had to read it a few times to understand that they
were saying. Then a 6502 assembly book got me going on the instruction
set.

Just have fun with it. My first assembly routine (hand loaded due to lack
of an assembler) just took one sound register from low to high. Took me
many hours but what a thrill when it finally worked without a lockup!
Of course, you could do it the _easy_ way and get an assembler :*D

Too much of "part of the OS" needs low RAM. You can't have your cake and
eat it too -- it's just not possible to implement multitasking and
demand-paging in 14K of OS RAM. Sorry.

Yup. The 65816 would help matters there. BUT, as you may recall, the Atari 8-bits don't have 65816s in them. For a new OS to matter to such a TINY market, it would need to be able to run on most of the STOCK Ataris out there.

I could image that if demand for the initial version of an OS that worked on stock machines was sufficient, later versions of that OS might add some of these exotic features. Contemplating them is a bit premature at this point.

(Talk about backing up carts.)
Steve has a program called cartcopy.bas. I have this somewhere also. I don't remember ever trying it. Steve says later carts would not copy using this program.
Right. I've heard that the xl/xe OS detects if there is a change in the cart slot, ie. if the cart is inserted after coldstart. For this reason, the 800 would be more likely to work with cartcopy.bas. However, there is a way around this as 'Impersonator' works on xl/xe machines and the cart IS inserted after startup.
On another note.
I've been posting to this group for months and cannot recall any followups to any of my posts. I'm really beginning to feel out of sync with this group. I didn't have anything to say about a new OS, as I think it's a lost cause.
Now, I know my posts are informative, thought provoking and witty. I guess my posts just leave other members of csa8 speechless.

I met a guy at a monthly Commodore meeting that I go to, who wants to trade me an 800XL he picked up from somewhere for all of these Transactor magazines I got free from someone else at another group. Now these Transactor mags are dates around 1983 +, and are interesting reading. Should I trade him? Although I have 4 working 8bit Atari's. None of them are 800XL's. And I think I may need an 800XL for the MIO2 when it comes out.

Any suggestions?

Seeing these Super Nintendos and Sega Genesis out there with the 4
Megabyte Cartridges (Donkey Kong, 32 meg (megabits - 4 MegaBytes),
I think it would be interesting to have a cartridge loaded with copies of
games and even emulated floppy discs, say games like Lode Runner would
run QUICK at boot and play. Anyone thought of this?

: answer is simple. The whole point of the new OS is to provide many new,
: sophisticated capabilites. In order to do this the new OS will naturally
: have to use more memory than the old one. Much more. This means that you
: have MUCH less RAM left for programs in low memory -- put simply, they
: wouldn't fit anyway.

: -Michael Ellis

I think I can offer some insight. Having used the Atari ST series, they offer indexed memory offsets based on where they load. You'd have to run all your old .COM files through a program that will turn absolute addresses into an offset counter. Then when the new OS loads these programs they will automatically be relocated in one option, or if you have all that memory, on every 20 msec page out the lower 64K to a high memory area, bank in another runnable program, execute 20msecs worth, then page in the next multi tasked program.

I just know seeing all the emulators out here on the Internet, "Never say Never"

Is there a simple way to upgrade an Atari 130Xe to 1 meg without pulling
it apart. Is this what the MIO does?

I'm interested ina box that has:
SCSI (that can handle 512K sectors)
at least 1 meg, expandable with 30 or 72 pin simms.
2 serial as R1: R2: (selectable)
Floppy emulation in RAM or hard drive.
Parallel port
FAST 80 columns
under $200 (I'm willing to go that far for this, how about you)

The FTE project looked good, what is the current state of that box?

I want to deck out my aged 130XE. I don't have an 800XL, which I hear is
the most expandable Atari (I used to have one).

>You're very right, check with Atari UK on that. %^)

I don't know about the 800 ROM issue, but you are way off base on the 2600.
The 2600 has no ROM other than the inserted cartridge. The Activision
emulator loads an exact image of the ROMs they used in their 2600
cartridges and does a real time emulation of the 2600 hardware. If you had
the action pack, the inclination and a ROM burner, you could make new
Activision game ROMs which could then be used on a 2600.

Atari in the US gave Darek Mihoka permission to include the 800/etc. ROM
images with his emulator. It seems to me the UK folks are just being jerks.

>>Sorry to all those who are finding the lack of ROMs a problem. I feel
>>that including the ROMs, although nice, doesn't help Atari users much.
>>He/she will still want to get their favourite software from the 8bit

>Or just go to atari.archive.umich.edu and download the files they've got
>there. They can be imported into Rainbow and used -- assuming you've got a
>DOS 2.0 or DOS 2.5 image to work with.

I'd recommend Chris contact the US Atari folks and get permission from
them. Besides being able to include the ROM images risk/guilt free, he
could thumb his nose at the UK folks by having done an end-run around them.

That may very well be, but, there is absolutely nothing special about
your computer. You're asking waayyyy too much for a used 130xe,
regardless of how well you took care of it. I've got an original 800
that is in perfect condition. The computer, the box, the manuals,
everything looks just like it came off the line. It cost me over $800
when I bought it new! Does that mean someone should pay me $200 for my
special unit just because I took care of it? No. I'm not flaming you
and i'm not putting your system down. I'm just trying to tell you that
you've priced it unrealistically high and that if you expect to sell
it, the price going to have to get a little bit more realistic. Good
luck. I think you're gonna need it.

Sincerely,
- Byron Followell

2028. SuperVideo 2.1/Flickerterm-80 Problem

Newsgroup: comp.sys.atari.8bit

From: Joe Walsh <ransom22@delphi.com>
Message-ID: <RRAj6hr.ransom22@delphi.com>
Source record: 89247

Hi,

As I noted earlier this week, my computer is having a bit of a problem
with FT-80 now that I upgraded it (800XL) to SuperVideo 2.1. The right-hand
side of the screen (what would be the 81st column in FlickerTerm) has lines
running up and down it. These are horizontal lines, about 1 character wide.
They do not appear right away. Only after using the computer for
15 minutes or more do they start. And even then, they only appear when new
text is being put on the screen (whether I type it or it comes from the
remote system). After another half hour or so, they appear all up and down
that 81st column whether new text is appearing or not. That is, it gets
worse the longer the computer is running.
This problem appears in NO other software I run. It did not appear
prior to doing the SV 2.1 ugrade.
Obviously, I did something wrong. I took the machine apart, and
everything looks OK. But, I am not too familiar with electronic hardware.
I must be missing something.
Does anyone have any idea what could be causing this?

Thanks in advance for any help or pointers.

-Joe

As I recall, the picture clarity for the scanner cartridge was almost
IMO exactly in between the joystick dongle & the Computer Eyes in quality.
In other words, if someone threw a dozen dumps on your table from the
3 different scanning methods, you would be able to sort them into three
seperate groups based on quality with about 90% accuracy. I went to the
trouble of buying a couple of fiber optic cables & LED emitter/detector
pairs to see if that would do a better job in the dongle config<g>, but
happened to get a hand scanner at the same time so it went on the shelf.
The dongle & the Easy Scan are both based on the stepper motor in the
printer reproducing the time it takes to move the head across the page
on a <RETURN> exactly so there is a little distortion in the scans. The
rez is also limited by what the printer can do, not a real problem for
Atari screens, but I think the recommendation is to use a copier that
will enlarge/reduce your original to optimum size.
I do a lot of idiot stuff, for instance, just saw an article in RE that
shows how to hook a FAX up as a full page scanner. This is going on my
hit list.
Rick

: neat hack, but it is quite different from multitasking those same two
: programs. In the first case you simply copy the programs in and out of
: "active" memory on demand. In the latter, you are actually doing two
: types of work at the same time.

This is the same problem they have in the MS-DOS/Windows world and one can conceive of a similar solution. Task switch old apps, multitask new ones. Old apps would likely want to use areas of memory which the new OS and new apps would claim, so even though they can't coexist, there should be enough memory around (Ala snapshot kernel) to share the memory and swap back and forth.

When running a legacy app, though, you'd have to concede the entire CPU to it. Only when running nothing but new apps would true multitasking happen. This is similar to the situation with Windows95.

This is the bane of backwards compatibility.

However, we should remember that the 65816 has a movable page zero. Wouldn't this mean that you could have multiple 64K areas that LOOK like the main 64K and run apps that way? But you'd still have to contend with the custom chip memory contention.

This is true up to things like the lack of memory protection, something which would be overkill with a new Atari8 OS, and it is well known that the lack of MP is a good part of what keeps the Amiga environment from being RAM-hungry.

OS-9 would be another good one to study for a low-memory model.

: I'm interested ina box that has:
: SCSI (that can handle 512K sectors)
: at least 1 meg, expandable with 30 or 72 pin simms.
: 2 serial as R1: R2: (selectable)
: Floppy emulation in RAM or hard drive.
: Parallel port
: FAST 80 columns
: under $200 (I'm willing to go that far for this, how about you)

The BLack Box does all that except:

no memory expansion
no 80 collumns
only R1:

FTE has mused on the idea of finishing the MIO 80 collumn board but who knows...
The MIO2 is IDE, not SCSI.

And remember, having a shitload of RAM won't do much for you if it's banked. Ramdisks are surprisingly slow compared to HD, you'd think they'd be a lot faster but because the 6502 is pushing the I/O it's not that much faster than a fast hard drive. That means if you want to play with linear RAM you'll want the Sweet 16 board and whatever means FTE develops to add RAM to it. I have heard of a PBI SIMM slot, but that doesn't sound great insofar as killing off other PBI devices.

2034. Rainbow ROMs from XTformer

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-12 00:00:00 UTC
From: Raul Silva <raul@silva.com>
Message-ID: <40j7h1$93f@quilla.tezcat.com>
Source record: 89253

How come Xtformer has the ROMS if they are not in the public domain?

I tried copying the ROMS using the procedure described in the Raibow docs
from within XT.
The ROMs copied fine but no I can't save them as a PC file so I can
transfer it to the Mac ARRG!
(BTW: I own 3 8-bit Ataris so I am not copying anything I don't already
own)

I tried trimming the file but there is no way to know where the rom code
starts and ends.

Any ideas out there?

2035. Re: Copy Cartridge to Disk - how?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-12 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <143532@cup.portal.com>

OK, my $.02: I believe the original cart copy was by David Young who did Omnimon, but... he used at least one illegal jump to the OS which is <IMO> why people complained the xl/xe series did not run 90% of the software, get it? The 90% of the software I imagine a lot of people had were these illegal copies of cartridges that were floating around. If you notice, Omnimon <& coincidentally Omniview> while having a hell of a lot of other stuff in there also are hard coded so the illegal jumps he made in CARTCOPY would now find the proper code. I've gone through the whole cycle (wonder why I never seem to get stuff done in a timely fashion? It's because I jerk around like this too much): CARTCOPY with a real 800 & original cartridge, test file, test file on xl <crash>, test file on xl with Omniview, rewrite CARTCOPY, test file on 800, test file on stock xl, ...
Anyway, I'm sure I could find the source for it if somebody needs it & I could probably post the proper way to do the load, but as usual I'm not infavor of piracy so nobody, no matter what they think, would be doing me a favor by sending me cracked carts.

I was cleaning out my closet a few days ago and came across an Atari 810 disk drive, an Atari 820 40-column printer, and an Atari 850 something-or-another. They were all in working condition to the best of my knowledge.

If anyone wants any of these items, pay the shipping charges (from L.A.) and it's yours. Let me know soon, cause I'm going to throw them away in a few weeks time.

Message-ID: <DD8uB5.3wJ@news.hawaii.edu>
Source record: 89163
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.tandy,rec.games.video.classic

well, let's try this again. Apologizies if you tried to make
an offer for anything earlier but never heard from me after. (Case
of bad timing for me, everything else just "happened" at about the
same time and mail piled up.)

I'll once again take offers on these for a couple of days
(until interest dies down) Updates as necessary through e-mail
(possibly one more public posting.)
Minimum bid listed, does not include postage. No extra
software included. Everything works unless otherwise noted.

...and my offer still stands to ship everything out in
exchance for a working Vectrex. =^)

Commodore plus/4 w/power supply [min $15]

Tandy Color Computer 3 128k [min $15]
most people who made an offer last time made the same offer...

Tandy "Deluxe" Joystick [min $5]
(pair) simple joysticks [min $5]

Atari 400 w/power supply [min $10]
first time I tried it it didn't work, though more recently
it did and without any problems, dunno...

The best place to look for old 8-bit computers is the same place you lost your original 400: garage sales, flea markets, thrift stores, goodwills, salvation armies, etc.

The trouble with such shopping is the prices are often all over the place. For instance, just this past weekend I came across a Commodore 64 with disk drive for $100 at a thrift store. WAY too much!! Yet, just a few miles away at another thrift store I found a Commodore 64 for $5, and a disk drive (both in original boxes) for $15, so the best thing to do is keep looking.

I have been looking for an Atari 8-bit for awhile now and nearly bought an 800 for $20 two weeks ago (this was at the same store that had the C64 for $100 believe or not) but decided to pass on it. And it's a good thing as I recently came across a mint condition 600XL in the box for $5.

2044. Re: IDE Drive int. $10! ARIGHT!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-13 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BBEjqd0.lmcclure@delphi.com>
Source record: 89166

In a message dated 8-10-95, Rob Funk said:

"If I understand correctly, the IDE interface is little more
than a PC's ISA bus extended across a 50-wire ribbon cable
directly to the drive."

Actually, the interface cable for a 3.5" IDE drive is 40 wires. (2.5"
drives use 44 wires for their connection, but the extra four wires carry
power and the grounds for the power inputs).

By contrast, the 8-bit section of the ISA bus uses a 62-point connector,
and this does not even include the additional connections on the "AT"
extension.

pmarcano@islandnet.com wrote:

>I have for your interest a complete ATARI 130 XE computer System for
>sale... A complete ART and MIDI system

>pmarcano@islandnet.com
>

Thankyou all for your input but the system was sold less than 36 hours after I posted it... I hope you can come to terms with that and keep in mind that as long as you devalue your investments in technology in your own eyes, forgetting that it continues to do what you wanted it to do in the first place, you only fall prey to exactly what the industry wants you to think... "we know you haven't figured out what to do with what you've already got, but hell it's outdated why don't you upgrade? and we know that as long as you're busy working your little ass off trying to keep up with us, you'll probably never realise it does more than you can imagine anyway!"

For crying out loud if you're not typing over 100 words a minute I hardly think you need a word processor any more sophisticated than AtariWriter on an 800XL. And as far as Midi information goes it's not going to travel any faster on any kind of upgraded computer system, it has to adhere to the standard, Miditrack III on an Atari130 XE was light years ahead of its time and is still perfectly practical for anybody who is writing songs using less than 130,000 notes. How many 20 minute epics does a composer write?

Upgrading certainly doesn't give you an imagination or inspiration and just because you're provided with a `virtual' airbrush in a paint program certainly doesn't mean you're any better equipped to use it creatively...

I don't think people should let the industry pull their strings so easily... look at the madness that's about to ensue when Windows `85' (that's Amiga Style- 256K) comes out for the PC in August! (needs 14 megs) Poor bastards couldn't do it right the first time, I'd hardly trust them to `upgrade' such a hog of an interface with any real concern for the consumer's pocketbook.

Anyway.. I digress, thanks again, the `old' system is sold.

Russ,

Your posts are truly all that and more. I for one applaud your efforts and request more!

Seriously, I had been trying to copy a cart to use with Xformer and using a cartcopy boot disk that has rotating characters that show whether the cartidge, when inserted, has locked up the computer or not. With my 800XL and 130XE, I just could not ever get it to not lock up. I just got an 800 lately and will try that. Although it seems to me I have used it before with the 800XL. I do know I used to use the 400 and while it took several times usually to insert and not lock up, it wasn't as frustrating as it has been with the XL. I'll try the 800 and let you know.

From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug13.223734.4945@wariat.UUCP>
Source record: 89170

(Bruce W. says he has a cart copy program that lets you know if the
computer locks up when the cart is inserted.)
The 800 might work with that program because, as you know, the xl/xe OS
has a cart 'change in status' check. I'm going out on a limb and say
it is part of the VBI routine in the OS. It can be gotten around
apparently on the xl/xe machines, but maybe your program pre-dated the
xl/xe machines.
Thanks for the response.

I`m new about this news group (NOT new to the .NET
though!) and I`ve recently aquired an Atari 800 emulator
for the P.C. It`s great, but if I may tax your combined
knowledge I`d like to know about the following...;

What is the:

MEMO PAD that comes up when you hit <SHIFT> F10?
How do you access sound?
How do you access ports on the Atari?

Can anyone mail me some good software .FXD files?

I`m into;

Adventure Games
Arcade Games
Music Programs
Utilities to get the most from the system
Art packadges

I`ll accept anything though!

Thankx a lot to anyone who can help me...

Great news-group!

I'll let someone else help you with getting software, but I can give you some
quick answers on these first questions...

1st....GET THE EMULATOR FAQ!! It's posted here periodically, and should
also be available at the archive sites (umich.edu, xmission.com). It gives a
LOT of general background on how Ataris work (including the answers to
these questions).

But, anyway:
1. MEMO PAD is a rather silly thing Atari put in so that the 400/800
(the original model Ataris) computers would do SOMETHING when turned on,
even if no cartridges were installed. The 400/800 models did not have built-in
BASIC, it came on a cart, just like a game cart. What MEMO PAD is is just the
full screen editor turned on, so you can type anything on the screen, using the
arrows, delete, insert, etc. Then the text stays on the screen until the com-
puter is turned off. You could write a memo to yourself or a message to be seen
by your spouse...get it?
2. & 3 are problematical if you have the emulator (especially the
shareware one, ver. 2.5). Ver. 2.5 does not do sound at all. Accessing ports,
other than the simulated joystick reading from the keyboard, would also be
unimplemented or weird. However, speaking as if you had a real Atari, the
easiest way is from BASIC (on the emulator, use XL/XE mode--those models
have built-in BASIC). The BASIC command for sound is "SOUND a,b,c,d",
where a is voice (0-3, four tones possible at once), b is pitch (0-255), c is
distortion (play with it!), and d is volume (0-15). "SOUND a,0,0,0" turns a
sound off. Joystick ports (0 and 1 on XL/XEs, 0-3 on 400/800) are read by
STICK(n), joystick trigger status by STRIG(n). Like:
10 A=STICK(0): B=STRIG(0): PRINT A, B
The ports on a real Atari would also read paddle controllers and could easily
be configured as I/O ports (some printer and modem interfaces used them).
There is also a serial I/O port, which connects all the peripherals--but dealing
with that is a whole other ballgame if you want to go beyond standard commun-

ications with peripherals (i.e., OPEN/CLOSE, READ/WRITE, etc.)

GET THE FAQ!!

;: to the Mac in about 5 minutes.

;: Should be ready before too long!

;Will this allow you to connect an 850 to your mac and access it?

If you mean can you use the Mac as a device from the Atari, then the answer
is no.

But you can transfer stuff from the Mac to the Atari with the help of
a small BASIC program. (LOAD and ENTER do not work with the R: handler)

Chris Lam.

2056. Re: Copy Cartridge to Disk - how?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-14 00:00:00 UTC
From: glenk@DSG.Tandem.COM
Message-ID: <40nte9$f5f@newshost.loc3.tandem.com>

Hi,
This is a "real" hack method that I've used.

I sacrificed a 16K cartridge that used sockets for the eproms. A ribbon cable equal to the number of edge connections were soldered onto the game card to bring the entire rom cart bus out to an "expansion" board that had two cartridge sockets on it. This could be compared to essentially an Atari 800. In one socket I used my Assembler/Editor cart which resides in 8K. The other "target" cartridge was placed in the second socket. That socket could be bank switched to read either rom of a 16K cart. A small program would sum the two 8K blocks together and write them to disk.

To run the cartridge file, all small init was added to the base 8K or 16K file. This init loaded the cartridge data into RAM occupying the same address (normally disabled when a cart is loaded). A flip flop and some simple decoding circuitry would disable the R/W line to the ram in the address block and thus make it "read only". The FF was set just before jumping to the cart init address. You could do hard reset my 800XL and still retain this "ram cartridge". I have yet to find a cartridge that wouldn't run with this method.

A second/third method I developed were cartridges using two 8K static ram or e2prom devices. The same decoding circuitry was added from above. The e2prom cartridge was especially useful since I could even turn power off and retain the memory. With prices of these parts today, I'd use this method for sure.

Yes, this sounds real cludgey but it works....

Regards, Glen

A real old time user....that paid $1300 for an 800 with 810 drive way, way, back!

Jerry's info about the 1090 not being able to handle IBM cards has to
be right since he's a former insider. Maybe what you are thinking about
is Dataque? At one time Chuck was fairly vocal about his plans for the
8 bit & one of his more aggressive ideas was to use IBM cards. One of
the problems that came up in the discussion was incompatibility between
the on board ROM on an 8 bit IBM style card & the 6502. It was suggested
that he try to make an interpreter for the 8088 code, but he suggested that
would be futile. His solution was to disassemble the on board ROMs & do
a translation to 6502 code. IMO: A daunting task since you have to be
completely versed in 8088 as well as 6502 with a complete knowledge and
memory map of the IBM buss.

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction is from Sunday, August 13th until Sunday, 20th
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be INSOMNIAC BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated.

Message-ID: <bwillard.62.000C7CFF@mindspring.com>
Source record: 89184

Okay, the name of the program is CARTDISK+. I gave it a try on my 800 and it works just about every time I push the cart in. The only trouble is I don't have the directions anymore, so although I can copy the cart to disk, then test load it (I was copying ASM/ED), I don't remember how to save it from the cache on the disk to an actual load file. This program does require debugging of copy protection, ie. store to ROM, but has some decent tools to do it.

Source record: 89186

(Pardon me, I said I would shut up about 'piracy'.)
A friend of mine paid $7000 for an Intel SuperBrain many, many years ago. He had/has very little software for this machine (a CP/M machine.) He asked me to find out what it was worth and help him sell it (last I knew he was using a 486/SVGA, etc.) I checked the CPM group and relate the following thread. Q: What can I do with an old CP/M machine? A: If it's a Morrow, you can use it to hold up your car with. Don't try this, however, with a Kaypro.

My friend's CP/M machine would be useful today to an extent. A word processor and a bubble jet printer and someone could do word processing with real nice output.

I'm convinced that A8 is not going the way of CP/M, because of the availability of 'cracked' software. Not so much the availability of the 'cracked' software, because I don't think CP/M commercial programs were copy protected much, but because people pass around 'cracked' commercial software with A8. Or I just don't know the right places to go to get 'replacement' software for the CP/M.

What's the point? I have no point. I was guessing I was out of sync with csa8 because people thought I had stuff I wasn't 'sharing'. It looks like, to an extent, I'm out of sync for just the opposite point of view I have been espousing. Good ol' Artem Koutchin presented essentially the same view I am, I just do it with a bit more manners, I think.

I'm never ceasing to be amazed at the level of people that show up here on csa8. Rick Cortese mentioned someone that was an 'insider' at Atari. There's the owner of ATV, Mike Hohman, Darek Mihocka and people who post who's names I don't recognize but may have been movers and shakers in A8. And possibly even lurkers who's names I would recognize. Rick Cortese and Rick (or Rich) Reaser and others (like Mike Jewison, Ben Poehland, Jeff Potter) know a wealth about the history and background of A8, as well as being a rich source of information about both hardware and software. These people make up the 'resources' that newbies and intermediates get a lot of answers from. It's what makes csa8 interesting.

And I don't want to fail to mention the glue that fairly well holds the threads together and answers most of the

questions, the unofficial moderator, Bill Kendrick (and
sometimes Glenn Saunders.)

```

I've tried the one character code with lots of success, but my plans are to eventually go past the single character into multiple characters on a command line, so I need full string input.

The InputS() function definately waits for the carraige return. When I do a simple Input and then print type program, there is no trouble with echoing what I've just typed. The big problem seems to be in the comparison that takes place in the DO...UNTIL loop.

Actually an idea just hit! There is a string comparison function, maybe if I use that to compare then test for a TRUE/FALSE result? Yes I think this might work.

Thanks for your thought provoking message. :)

Yes I've been noting some interesting results from undimensioned arrays.
Namely all sorts of garbage in the editor when I return from running the
program. I have to shut the computer off to get rid of it.

```

Thanks for the response, I've also been learning C, and it handles strings a tad differently.

I totaly forgot about the length indicator in positon 0. I guess that's why the comparison kept failing.

I figured out an alternate way to test for the string result by using the string comparison function, and then testing for a TRUE/FALSE result. I haven't tried it yet, but I figure I will just to see if it works.

Thanks again for your help.

From: jeking@xmission.xmission.com
Message-ID: <40q086$9ni@news.xmission.com>
Source record: 89107

Is there anyway that an HP DeskJet 540(c) can be used with the 8bit Atari. I tried directly cabling it into my 8bit, but got NOTHING - not even garbage.

In addition, I tried to use the HP via the PRINT THROUGH option on SIO2PC and got garbage, but couldnt get it to print anything readable.

Any help GREATLY appreciated!

I believe copyrights run for 50 years & they can be renewed so we have about another 35 years <whew!> to go. I'd guess the chance of the copyrights being renewed is nil/null. No corporation could justify the expense for a former product that isn't generating income. Certainly if we manage to keep some of our software working our grandchildren will be able to play PAC MAN.
I'm a little funny about intellectual rights. For instance, I recall once sending out a memo detailing how to calculate the length of substrate on a roll by the thickness of the roll. Over the next 5 years I had two friends ask me for a copy of the original memo & sure enough, it came out with their names on it in two different departments, I didn't mind this at all. But we also had a guy who made it to the top by a combination of plagiarism & character assassination. I used to get so upset with this guy I would break out in a cold sweat. The spoken, never written, policy of the company was, "It is in our best interest if other companies believe we have a genius employed here. To that end the more patents he gets the better. What is good for the company is good for you so you shouldn't complain."
It put me in a moral bind that I resolved by leaving the company. It also made me make a choice as far as things like copyrights are concerned. I've got a lot of respect for anybody that produces a creative work, with that respect goes at least the right to prevent people from using it for free if they so choose. You may not like them for preventing you from using the software for free, but they still have the right.
Whew! Too verbose!
Rick

The design Nir Dary made was not only an ANTIC swap, but an OS hack.
I've found I can live without the OS hack. If you're in such a hurry,
simply get ahold of a PAL ANTIC and stick it in in place of your NTSC
one!

Truly the greatest resource of this (or really of any) newsgroup is the personalities which inhabit therein. I don't read a lot of newsgroups (I have a life, thank you very much :-) but of the unmoderated groups I do read I think that c.s.a.8 has one of the best signal-to-noise ratios, even taking seasonal variations into account.

Oh sure, we get caught up in many of the same old discussions when new people discover the group. Just look at the hornet's nest Artem stirred up earlier this year. Shucks, I've even been known to lob the odd virtual incendiary device myself. But by and large the core members of the group are an extremely knowledgeable bunch of individuals who will share what they know at the drop of a hat.

I find it kind of amusing to have my name included in the above list because I hardly consider myself a resource. Sure, I hack around with the machine (or at least I used to until I changed jobs last year) but my technical knowledge of the inner workings of the machine is next to zilch (from my perspective, anyway). Actually, that's another strength of the group - person A considers person B to be a resource, while B has the same attitude towards A.

[tears welling] Oh damn, there I go getting sentimental again. Time for a group hug.

"Woefully adequate" eh? Sort of like the IRS? ;-)

I agree that the bulk of 8-bit owners are not going to run out and get 65816s to support a new OS. I WOULD have a few years ago, but now I keep my 8-bitter around simply for the stuff that works on it presently, and I'm not interested in beefing it up beyond what is currently available.

I've used/owned/hacked Atari 8-bits since they were first available, but I'm not likely to want to try to implement a new OS for the same reason I don't want a new OS for my Altair 8800 - it works, I enjoy using it, but it's no longer my primary system and I can't see myself staying up nights just waiting for the latest software to run on the new OS.

I'll probably keep my Atari forever, it has been one of my favorite systems, and I can say I'm happy with it just the way it is.

John:

You're right about the first two switches setting the drive number, and
the second two control density OR put the drive into diagnostic mode.

The settings are:

switch1 switch2 switch3 switch4
Drive1 off off * *
Drive2 on off * *
Drive3 off on * *
Drive4 on on * *
Lo density * * off off
H1 density * * on off
H2 density * * off on
Diagnostics * * on on

off = down

Good luck - I love my Rana 1000, running great since '83.

Stop this plane, I'm getting out.

Not to put a damper on things but Crawly Crypt 2 contained what I believe
are the complete 8 bit archives from U mich on it. Cost $34. The above
CD must have a lot more on it than that since Crawly Crypt 2 also had
tons of Falcon and ST software - some TT also. Without actually
checking, I would guess it had maybe 10-20% 8 bit info on it. Wayne

I'd say the feeling here is very much like the feeling I got at our monthly user's group meeting. A lot of stuff gets thrown around, separates into groups, then recombines for a different discussion. I belonged to my group, (The 4 Aces), for about 5 years (president for one, and ran the BBS) and never got tired of it. I truly miss those meetings now and this is a great replacement. I travelled a lot during that time and found Atari users pretty much the same everywhere I met. I struck up quite a few friendships because of a common interest in Atari's. Especially with the competition with the Apple IIe and C-64. I always did and still do believe the Atari ran rings around them and could not understand why the public couldn't see it. Atari feelings run deep!

I don't understand why you would get garbage with the PRINT THROUGH mode
via SIO2PC. But have you tried using an 850 Interface and an 850 Printer
cable? I have never actualy tried hooking up my DeskJet 660C to my Atari,
never had much of a need for it, since I do most of my word processing and
desktop publishing on the PC under Windoze. (Yeah it blows, but I don't
see any nifty programs that can do this stuff under DOS).

What a great story! Thank you for sharing it.
Although I have no children (and most likely never will for a variety
of reasons), it has been a sometime-dream of mine to "pass the torch" on to
another generation some day. Maybe the kids of the neighborhood will visit
"old man Walsh" 50 years from now, and check out the Atari he keeps working
with scotch tape and spit.[G]
Anyway, I'm glad your children are still interested in the old
machines.

The mortal Michael Ellis wrote:
: Yup. The 65816 would help matters there. BUT, as you may recall, the
: Atari 8-bits don't have 65816s in them. For a new OS to matter to such a
: TINY market, it would need to be able to run on most of the STOCK Ataris
: out there.

Therein my conception differs. I happen to firmly believe that a stock 6502 is woefully adequate as a staging ground for a preemptively multitasking environment. We had a thread before which essentially answered why it is that the 6809 can and the 6502 can not.

It would be such a major kludge that it would not be worth it.

Dudes, we've got 1 major developer left. CSS is essentially a dead issue, we should try to drum up support for the damn Sweet 16 otherwise it will flop just as much as Chuck Steinman's T-816.

We'll never go ANYWHERE if we consistenly fall back to the lowest common denominator

It is IMPOSSIBLE to write a preemptively multitasking system on a 64K 6502 system. It is not worth the effort but probably possible on a heavily upgraded banked-ram machine, but if the guy has enough initiative to throw 512K into his machine, why not a friggen Sweet-16?

If someone is too cheap to put more RAM into his system he shouldn't whine by not having this OS. Most likely all he does is play games on it anyway.

Source record: 89196

OK, by request some of the code from CARTCOPY, the whole file is
something like 8k so I won't post it in the sig.

```
LDA $6A ; Checks ramtop
CMP #$90 ;makes sure OS thinks ram
BCC $630 ;stops at $9000
LDA #$90 ;
STA $6A ;
JSR $F3F6 ; Offending code!
LDA $6000 ;it is a direct jump to
INC $60E ;the OS screen open routine
BNE $618
INC $60F
STA $A000
INC $619
BNE $60D
INC $61A
LDA #$C0
EOR $61A
BNE $631
JMP (BFFA) ;cart RUN address
RTS
JMP ($BFFE) ;cart INIT address
;I don't think this is
;the way to initialize a
;cart either!
```

More code on page six followed that snippet.

This code frag is in line 1470

```
1470 DATA 133,106,32,246,243,173,0,96
```

i.e. $F6 $F3
All right, the proper way to do this is to just open the screen via
the OS vector at $E410, $E411 plus 1. The way you're supposed to do
it is indirect return through the stack, something like:

```
LDA $E411
PHA
LDA $E410
PHA
RTS
```

As a matter of style I usually use something like

```
LDA $E410
STA HERE+1
INC HERE+1
```

```
LDA $E411
STA HERE+2
HERE
JSR $FFFF
```

But I'm beginning to wonder why?

But for the sake of argument, let's say you really only want to patch these files to be XL compatible vs compatible with everything. It means you need one version of the file for each OS type, but someone will/may jump in with a universal patch.
If you're running the file on an 800 to make files for an xl or trying cartcopy with an xl, just change the two bytes in line 1470 to:
142,239
which is the xl OS screen open routine. If you have a bunch of these files that won't run on an xl & want to patch them, it's a little tough. David did something very unusual, instead of running the ramtop lowering portion first, he loads the entire cart file into ram at $6000 to $7FFF, lowers ramtop, moves the entire $2000 bytes to the $A000-$BFFF region, then does the cart initialization! It could have been so much easier! Anyway:

```
10 OPEN #3,4,0,"D:inputfile"
20 OPEN #4,8,0,"D:outfile"
30 FOR N=0 TO 8212
40 GET #3,A
50 PUT #4,A
60 NEXT N
70 GET #3,A:GET #3,A
80 PUT #4,142:PUT #4,239
90 FOR N=8215 TO 8259
100 GET #3,A:PUT #4,A
110 NEXT N
120 CLOSE #3:CLOSE #4
```

I've run this with a file created under cartcopy <BASIC> & it patched fine for use on an XL OS.

>How come Xtformer has the ROMS if they are not in the public domain?

I obtained permission from Atari to use the Basic and OS ROMs in my emulators back in 1987. That's why all versions of ST Xformer and PC Xformer (and any new versions since it's all just different versions of the same emulator) all have a copyright message from Atari as well as a used with permission message on the title page.

As for people who include ROM images without permission (as that rather lame German Atari 800XL emulator did) or people who write emulators that require you to steal the ROM images (such as Rainbow or STonX) without obtaining permission from Atari, well, they've got their fingers crossed hoping that Atari doesn't care. :-)

Well, assuming you don't fell like building your own SIO2PC cable,
there are people with SIO2PC cables that are willing to transfer
your Atari disks over to 3.5" PC disks.

If you look at our recent product announcement for PC Xformer 3.2,
which is on the net at http://www.halcyon.com/brasoft/pcxf32.html,
we list the names of several third party developers that make
the SIO2PC cable, offer disk copy services, etc. Creative Software
Systems are who you want to contact about getting your disks copied
over.

2096. Rana 1000 Dip Switches

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-15 00:00:00 UTC
From: bosco@yab.com
Message-ID: <40pbh9$c9j@news.yab.com>
Source record: 89201

Help! I have a Rana Systems 1000 disk drive, but not the docs/amnual. On the back of it is a set of dip switches numbered 1 thru 4. I figured out that the first two are to set the drive number, but the last two a mystery to me. I believe they have something to do with setting the density.

Any help would be greatly appreciated.

John Collins
NWPAC

2097. Re: Rainbow at InfoMac

: > could thumb his nose at the UK folks by having done an end-run around them.

: *apologies if this news has already been posted*
: If you get on the Umich Atari archive 8-bit section, you'll find version 2.*
: of PC XFormer. Within the archive are - you guessed it, the 8-bit
: ROM files you need to run Rainbow.

More specifically, the following works:
1. Download atari/8bit/Xf2/xf25.zip from the umich archives
2. Unstuff. (Make sure the name of the file you try to unstuff ends in .zip)
3. Copy ATARIBAS.ROM and ATARIOSB.ROM to the folder containing Rainbow.
4. Rename ATARIOSB.ROM to OP_SYSTEM

Voila! I was totally suprised when I saw the old Atari right there
in a window. I expected it would take hours of hacking the ROM
file, but it was effortless! What an impressive program.

BTW, does anyone have the author's email address?

Mike White

From: jeking@xmission.xmission.com
Message-ID: <40pvvo$9ka@news.xmission.com>
Source record: 89204

Got my first prototype 8bit Atari CD last night - and it works perfectly.

Has a few flaws, but I figured that much -- I'm not a pro and am not even attempting to try to do a serious professional job.

Should be mailing out all CD's by end of the week. Just need to type up a quick document to include with each one.

Had a cool label made for each CD that displays a complete Atari 800 system!

Note: This is not a commercial endeavor. I wanted to do this for myself, then after I got a few messages from people asking for a copy, decided to make duplicates. I am in NO way making a profit off this thing, as the CD's cost $50.00 each to create, and I'm only asking $50.00 - thereby leaving the shipping costs up to me.

Any questions? Feel free to firee of a mail!

2101. 8-bit computer equipment -- FOR SALE/TRADE [08/16/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-16 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <40rvtu$d4k@ixnews2.ix.netcom.com>
Source record: 89123
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy,comp.sys.ti

updated 08/16/95

I have the following 8-bit computer equipment for sale or trade. The list
includes systems from Atari, Commodore, Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been tested and
are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which
will be sent via U.S. Snail. The shipping cost depends on both the weight
of the package and the distance that it is traveling. The buyer has the
choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn
from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money
Order, payable in U.S. funds. This is the only way I have found to deal with
my friends to the north (my bank is very picky, but the U.S. Post Office will
cash a Canadian Postal M.O.)

* = (after price) Tentatively sold/traded. Inquiries welcome.

*****

LOT #1

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet,
so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and one (1)
Molex
connector cable.

$39.00

built-in BASIC.

This is a complete system, except for RF switchbox.

$14.00

*****

LOT #11

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF
switchbox,
Beginner's BASIC (150 pgs.), one function key strip (for keyboard), and
four (4) cartridges [no boxes or manuals for cartridges]:

BEGINNING GRAMMAR
CAR WARS
MUNCH MAN
PARSEC

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to play.

$34.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video
game
systems and/or cartridges in trade towards any of these items. Systems
I

am interested in include, but are not limited to, the following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking
for now is software (primarily cartridge based).

Please send a list of what you have, and I'll let you know what I can
offer.
Please be specific, and indicate whether or not items (cartridges
and/or
systems) include the box and/or instruction manual. Please also
mention how
many, and what kind, of controllers are included.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for them, but
I will
not guarantee that I find them. Shipping will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS WILL BE $1

-Atari 2600 $5.00 min

-Atari 2600 jr, no cables not working

-Atari 7800, no cables $13.00 kurt

-Atari 1200XL no cables $8.00 kurt

-Atari 810 Disk Drive $5.00 doug

-Intellivoice for Intellivision $4.00 min

-Atari Keyboard Controller $2.00 kurt
-Atari Paddle Controllers

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction is from Sunday, August 13th until Sunday, 20th
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be REAL BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated.

2103. TRADE: my 2600 HERO for your Atari 8-bit carts

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-16 00:00:00 UTC
From: "A.P. Hilliard" <pash@en.com>

Source record: 89125
Cross-posted to: comp.sys.atari.8bit,alt.games.video.classic,alt.atari.2600

I recently picked up an extra copy of the rare and fun Activision game H.E.R.O. for the atari 2600. I also picked up my first Atari 8-bit computer, a 600XL.

Since I only have 4 carts for it (Pac-Man, Qix, Megamania, and Frogger) I would like to trade my HERO cart for 2 or 3 Atari 8-bit carts. I'm interested in just about any good games: Dig Dug, Missile Command, etc.

Best offer gets the cart.

Hi everybody,

Does anybody know if it is possible to
connect an ATARI (130XE) to an VGA-Screen ?

I have an CTX1785 with two Video-Inputs :
VGA plug and R/G/B/H/V (5 coax plugs).
My VGA plug is connected to my PC but the
available plugs could be used for my
ATARI, couldn't they ? Does anybody know
how to connect to a VGA-plug or even to the
R/G/B/H/V plugs ?

Thanx, mario

If I recall correctly I have pointed out how one can multitask two or more
programs on a 6502 with each having their own stack etc. a few months ago...

>We'll never go ANYWHERE if we consistenly fall back to the lowest common
>denominator

>It is IMPOSSIBLE to write a preemptively multitasking system on a 64K 6502
>system.

I have to disagree with that! About one year ago I was thinking about
writing a new, preemptive multitasking OS for a stock atari 8-bit also, and
I have complete plans written down on paper for the Memory Manager, the
File system, the device drivers and the kernel. It's probably in my drawer,
on top of the notes I made about new MODPlayer and underneath the JPEG decoder
notes :-) But seriously, I believe it is possible to make a multitasking
OS for the atari 8-bit, but people have to stop thinking that it will also
run their old software. I should be a _completely_ new and different
environment, like running linux on a PC which used to run MS-DOS.

Charles, look on the Branch Always Software emulation web page at http://www.halcyon.com/brasoft/ for information on PC Xformer 3.2 (the latest commercial version of the 130XE emulator for your 486). You can also download PC Xformer 2.52, which is free Atari 800 emulator, much slower and a little crippled, but it will give you an idea of what the emulator can do. You can then order PC Xformer 3.2 from us for only $29.95.

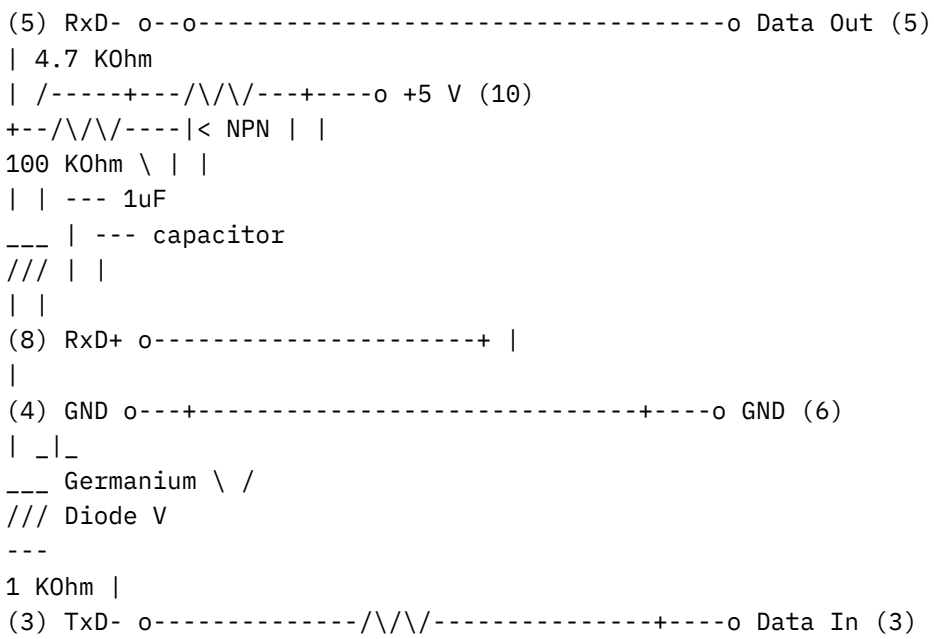
2113. SIO to Mac info

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-16 00:00:00 UTC
From: lucius@astro.ocis.temple.edu
Message-ID: <40td47$ht9@cronkite.ocis.temple.edu>
Source record: 89135

I have, if anybody is interested, about half of the SIO2MAC program -- the half that lets the Atari read virtual disk files from the Mac. I have been working on other projects lately, so the SIO2MAC program has been on the back burner.

Also, there's an idea I have about the hardware involved in building this thing. I have a Macintosh PICT file which shows how it goes together, which I've converted to ASCII. The numbers in parenthesis are pin numbers.

Mac DIN8 Atari 13pin
Serial Port SIO



Resistor

The bottom half of the diagram has a diode which takes the Mac's transmitted data and keeps it above -.3 volts. Since the Mac has already inverted the logic on the TxD- line, no further conversion is needed.

The top half of the diagram takes the Atari's TTL levels and sends two copies to the Mac: one inverted and one uninverted. Because the Mac's RS-422 serial port senses when one line (RxD+) is more negative than the other (RxD-), it's a simple matter of having one line at +5 volts while the other is at 0 volts.

The NPN stands for a NPN Transistor, which can be a general purpose type. Its job is to invert the logic level signal: when there's +5 volts on the left side, the upper right side has 0 volts, and when there's 0 volts on the left side, the upper right has +5 volts.

On the Mac end, you'll need a Mini-DIN-8 plug with the correct pins wired. Some modem cables have the TxD- and RxD- pins connected to ground -- you
can't use them. You can use something like a serial printer cable, or you can also buy the plug from Digi-Key and solder it together yourself.

For reference here's a diagram of the end of a DIN-8 plug:

6 7 8

3 4 5

1 2

On the Atari side, you can use a regular 13-pin cable, and here's a diagram of the end of the plug:

```

I just picked up a 5200 for basically nothing, but it is BARE. By bare, I mean no joysticks, no power supply, no connector to plug a supply into. Matter of fact, although there are a couple of open holes that look like they used to have wires for power, I can't tell whether that's really where they go or not. I thought the 5200 was basically a modified XL, but the internal supplies are very different, as is the layout. I'd like to try it out, but need to know what kind of power and which points they go to. My guess is I can probably use another Atari supply, but which one? 800 or XL/XE?

Bruce,
Is it a 4 joystick port model??? I have one of those. The PS, which
I believe is the same as the 400/800/810/1050 PS's, plugs into the RF
box. The rather hefty looking RCA cable running from the bottom supplies
the video signal and gets the power for the machine (Atari wanted to
eliminate all those unsightly cables running to your console by
consolidating them to the back of your TV). I believe Greg Chance's
homepage has instructions on building the hybrid RF box is you don't have
one (which it sounds like you don't)...

2117. Cart copying? An update

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-16 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug16.194011.29697@wariat.UUCP>
Source record: 89139

(This is posted without reading the group's last 16 messages. I'm in a hurry I guess. I download the new msgs., log off, compose replies which I post next log-on.)
My simple cart copy (crack) said 'follow the code'. There is that, yes. But in 'Math Encounters', and probably most fairly simple cart cracking, there's a byte stored to $A000-$BFFF, right? So, I remembered what I did. I dumped $A000-$BFFF with the cart in. Then I ran the dump and let it lock up. Broke back into it and dumped $A000-$BFFF again. Then I ran a comparing program that compared the cart areas from the two dumps. That's how I found the address where the 'bad' byte had been stored. I guess I really didn't need to find the indirect store that did it.

Source record: 89140

Also, be care about using the supply from another system. The 5200 uses an 11.5 VDC power supply which I believe is unique to it. I don't know what kind of over voltage protection it has, but I would be very careful. It would be fairly easy to build one with parts easily attained at your local Radio Shack. As mentioned, check out Greg Chances home page for more info.

You know, my youngest son, who knows nothing about electronics (whereas I am an electronics service tech) said that it probably gets it's power from that cable. I said, "No, that would be ridiculous!" Oh well, live and learn. By the way, it is a four port machine. Thanks for the info.

2121. Bugs in DISKRX and CLEANUP?!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-16 00:00:00 UTC
From: CONRADUS@PLEARN.EDU.PL
Message-ID: <199508170440.XAA28880@mail.cs.utexas.edu>
Source record: 89143

Hello.

1. DISKRX.COM (from FTe's SpartaDOS Toolkit) does NOT work with my hard drive. The program probably stores some data at PDVMSK ($0247) - if I disable the drive by setting the PDVMSK to zero, DISKRX comes to work properly (but the drive is off). Does anyone have any ideas?

2. CLEANUP.COM (from FTe's SpartaDOS Toolkit, too) seems to work properly with STANDARD DISKS ONLY. I have written a ramdisk for SpartaDOS X. The boot loader is quite useless in ramdisks, so my driver stores the bitmap to logical sector $0002 instead of $0004 and the disk capacity is bigger. All variables in the boot sector and bitmap are correct, but the CLEANUP reports, that it is wrong and wants to write the boot loader to the disk. My question is: does anyone have the source code of the CLEANUP to correct this mistake?

Konrad

Lucious, just a suggestion or two. The 100k resistor going into the NPN transistor is a little bit on the conservitive side. Figure the NPN transistors will have anything from 20 to 200 for the amplification so worst case part it will only transfer something like (5V/100k)(20) amps or about 1 mamp. AFAIK, the lines in a lot of Atari stuff are pulled up so it may not be enough horse power to get the job done. Figure RS232 specs imply it's supposed to be able to drive a 3k load & maybe use a 3k-4k resistor to the base of the transistor. Also, a safer way to do what you have listed as a germanium diode would be to use either a zener or a zener in parallel with a germanium diode. With the current design, if the Mac put out a 12V signal, the data in port of the Atari would see +12V through the resistor. If you had a 5.1V zener, it would perform the same forward switching as the germanium diode <albiet not quite as well> and would limit the voltage on the Atari to the +5.1V, well within the specs for TTL. Of course if you want to change the NPN to a Darlington transistor, that changes everything<grin>.

>systems, and I can say I'm happy with it just the way it is.

These are accurate words. I like all this talk about a new improved OS
and it's real exciting for people who still use Atari-8's a lot. However,
the simple fact is most Atari owners use (program, games, whathaveyou) it
is exactly BECAUSE of its simple OS and familiarity to them. I've known
more than one person in the past to own and do pretty interesting things
on Atari-8's because it was a break from the computer work they did all
day long on Unix computers, for instance.

I don't want to rain on parades, I think the ideas expressed here are very
interesting, and I've spent many hours myself on these very same topics of
upgrading the Atari. Heck I still do. But before anyone goes and puts
their heart, sweat, tears, and hours of coding/debugging into this project;
I think it's prudent to convince yourself that very few people will want
to use this new OS. What I'm saying is don't do all the work expecting it
to be a hit and everyone to switch to it. If it experiences a popularity
BooM, then Bravo! and HURRAY! However, don't be expecting said BooM...

Having said that, I'll plink my 2 cents in for the OS if no one minds..

It should work fairly well on a stock 130XE, or a 256K computer.

It must be simple to switch back and forth between New and Old OS's.
(this is really the trick I guess. I would rather have a Boot switch
or menu loader than try and have the New OS keep watching its toes for
the Old OS!)

Keep it fairly simple to code/port programs to the new OS. (of course)

Generally "KISS", keep it simple stupid!

I don't have too much interest in an entirely new and different OS, but I've always thought that the current OS could be cleaned and tightened up a bit:

1. Remove cassette support.
2. Remove those silly self-test programs, except for, possibly, a minimalist memory test.
3. Speed up the E: handler (already done by several people).
4. Remove the "fill" operation of the S: handler.
5. Generally reduce code size (there are some short subroutines that are only called once, etc).
6. Speed up the floating point routines (a la Newell FastChip).

Use the extra space to implement some/all of these:

7. Simple DOS 2.5 D: handler (would drop boot times way down). Possibly, some features could be omitted for space reasons, like lock and unlock.
8. Mini machine language monitor.
9. A simple routine to mark expanded memory banks as "in-use" so specially written programs can deal with extra memory in a nicer way. Include an easy way to test if this routine exists.

Nothing radical, I admit.

Vince, a few things you can forget, 115k baud & Windows. I can't recall all the incarnations, but a '286 would probably have an 8250 in it to handle serial chores. The chip can be set to 115k baud, but it wasn't designed to do anything like that. I think they're supposed to flake out around 38k baud. I should pull out my spec sheets, but I think they only have a 2 byte internal buffer: This is completely inadequate for that speed & specifically for running under Windows. I have gotten SIO2PC to run as a background task using a 8MHz 8086 & Deskview, but my son trying to show me/convince me that Windows 3.1 & OS 2 Warp were advanced to the point where I would want to use them tried for weeks to get SIO2PC to run in the background on a 486/33MHz. The best he could do was run it in the forground DOS window with something like 90% system priority and even then it would routinely give NAKs to the Atari. I haven't heard of anybody substituting the new 16650 serial chips to see if they would work, but the thing is they cost about $10 each. Last motherboard I bought at a local shop had 640k, built in [disk, printer, serial] support & only cost $7.99! If the thing would of had video also I would have really been a happy camper.

Why not just do task switching on every Verticle Blank? A user installed routine could keep track of where in memory background and foreground tasks are, and run each one within the time in between Vblanks.

I suspect that there would be problems in keeping old programs from colliding with each other. The system needs some kind of protocol so that a program could poll the memory manager for safe regions to stick programs and data. This however would require new programs that adheared to a standard protocol.

The only way I could see to keep programs from colliding is to have the memory manager keep a table which contained the address being requested, and the address that the program or data was actually stored at. There would also need to be an number assigned to each entry in the table indicating which program/task the entery refered too.

Okay here's an interesting question. What happens to the screen displays if you're running a task switching OS. Each 8-bit program has a screen display, what's stopping one from over-writing the others when it's time slice comes by? Or even another possibility, will a background task which is switched into the foreground to be worked on by the user, be able to redraw it's screen properly? Also won't the machine quickly run out of memory even if it can find someway of storing all these displays?

Finally one more, would one be able to continue to use fancy tricks like display list manipulation, etc... ?

Just some thoughts I've been wrestling with.

Nope. The 5200 uses a 11.5 VDC power supply, same as
used on the INDUS GT Disk Drive.

Russ Gilbert (Russ.Gilbert@apk.wariat.org) wrote:
: $A000-$BFFF again. Then I ran a comparing program that compared the
: cart areas from the two dumps. That's how I found the address where
: the 'bad' byte had been stored. I guess I really didn't need to find
: the indirect store that did it.

Bwwaaaahahahaha.... :-)

A brief story:

Aric W. and I (and maybe one or two other sickos) spent some time during the Twilight Days of Atari thinking of copy protection schemes for cartridges. Strictly idle in-between-layoff amusement, you understand. There were mandatory beer busts back then ("You *will* have a good time, drink beer, and come up with creative, profitable game ideas!").

Oh, gad, upper management wants us to invent winning games -- and we're stuffing eight to ten million E.T. Phone Home cartridges into L.A. landfills. So we plotted how to drop-test an '800 off the roof of the coin-op building, except that all the roof access was locked and alarmed. I think someone hacked the PBX to dial people at random and connect them to the building-wide public address system ("Hello? Hello?" in the hallways). And we thought about copy protection.

Despite the most twisted, obfuscated schemes we came up with ("Put the PC in the stack, it's looping there, and then an interrupt comes along, the high byte of the return address is an STA, and we decrypt another byte of the smasher into screen memory...") I could imagine some talking to some pirate at a user's group meeting:

"Yeah, that was a hard one. Took three days to crack."

... and sure enough, that's what happened. I was highly amused.

A.P. Hilliard (pash@en.com) wrote:

: I recently picked up an extra copy of the rare and fun Activision game H.E.R.O. for
: the atari 2600. I also picked up my first Atari 8-bit computer, a 600XL.

: Since I only have 4 carts for it (Pac-Man, Qix, Megamania, and Frogger) I would like
: to trade my HERO cart for 2 or 3 Atari 8-bit carts. I'm interested in just about
: any good games: Dig Dug, Missile Command, etc.

: Best offer gets the cart.

heh! ONE 2600 cart of a so-so game for THREE carts of so-so XL/XE games?
C'mon, get real. Or better yet, get a disk drive. The best games come
on disk as opposed to carts.

2134. SIO2PC-like device for Amiga2PC

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-17 00:00:00 UTC
From: chair@pgh.nauticom.net
Message-ID: <DDFnBG.E3I@pgh.nauticom.net>
Source record: 89150

Hi all! I know this group is for Atari 8bits, but its participants seem to like Amiga's, and this is based on an Atari device.
Is there a device, like SIO2PC, to connect an Amiga to a PC? I am currently in the process of collecting parts to build an SIO2PC cable, and have previewed the software, and like it. I also have MS-Interlink to connect 2 PC's (it lets the client PC use the drives of the server PC via a null-modem serial cable, the software comes w/ MSDOS 6.x)

I'd like to connect have my Amiga 1000 use my 286 pc as a file server. Eventually, i may collect enough scrap boards & parts to either build or fix up a bare bones 386 w/ a couple of serial ports. I'd then run the server programs of SIO2PC, Interlink, and Amiga2PC(?) simultaneously on different ports under windows 3.1. I'd also make it autobooting so i wouldnt have to have a dedicated monitor/graphics card. Such a poor-man's file-server would be great for sharing data between platforms and generally making otherwise floppy-based systems easier to use (my 286 does have a 40m hd, my A1000 and 800xl don't).

The proposed Amiga2PC device would preferably be transparent to the Amiga, like SIO2PC. However would probably require a driver of some sort on the Amiga side, like Interlink. I've had several thoughts on how to make such an interface:

1. A 115k rs232 connection via the serial ports w/ a driver for the amiga & server software for the pc.

2. An interface to the Amiga's external disk drive port might be more transparent to the Amiga, but the Amiga may have trouble handling the disk size. This way would probably require more hardware, and maybe even a driver on the Amiga, which would make the previous idea more plausible.

3. Another way would be to make a device to plug into the Amiga's expansion slot. This would require more hardware, as well as (probably) a driver for the amiga. The disadvantage of this is that it would be specific only to the unit(s) it was designed for: either 1000, 500, or 2000... .

Any thoughts on what may or may not work? Do such devices exist? If someone out there could send me or point me to the relevent information and or a good c or pascal compiler for the Amiga (public domain, shareware or cheap commercial, also needs to run on an Amiga 1000) i'll start working on such a setup.

Thanks!

Vince

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, public domain
```

software/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Date: 1995-08-17 00:00:00 UTC
From: "Ernest.R.Schreurs" <ernest@pi.net>
Message-ID: <410ep8$671@neptunus.pi.net>
Source record: 89153

ddahlstrom@mhv.net (David Dahlstrom) wrote:
>Does anyone know if there is a place that sells
>classic Atari 8-bit software in a form that can be
>used by the PC XFormer.

Try and find a BBS that has 8-bit stuff, or download it from one of the FTP sites. The PC-Xformer allows you to store 8-bit files as a normal PC file, and when you tell it to open the file, it creates a disk image that contains that file. You can then simply save this as a XFD file. Another option would be to have a notebook computer with a SIO2PC cable and bring that to a shop or usergroup that has an 8-bit system setup.

2138. WANTED: "Atari Connection" circa 1983

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-17 00:00:00 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <40vfrr$9ka@erinews.ericsson.se>
Source record: 89154

I am interested in buying old issues (circa 1983) of the
"Atari Connection" magazine. I live in Sweden, but I will pay
in advance if the seller is in the US.

/Anders Skelander

This won't work due to the fact that Interlink will not run under
Windows, and I've heard that SIO2PC has problems running under
windows. You would probably have to go to a heavier duty OS like
OS/2.

This brings up a suggestion, has anyone had ideas for a true computer
network for older computers? I've been think, since I have several
8-bits and a ST, it would be nice to network them and use my 486 as a
file server. Here are a couple of my thoughts:

1. If I understand correctly, the original appletalk interface was
nothing more than a fast serial port on the hardware side, so couldn't
we use the RS232 ports as a network port? We would be limiting
ourselves to probably around 19.2, but that should be plenty fast
enough for Atari 8-bits, Atari STs, apple //s, C-64's, Acorns, and
whatever else can get some network drivers written for it.

2. For the Atari 8-bits, I would think you would still have to have a
real disk drive to boot off of, and then it would load the network
drivers and set up a new device (N:?). You would then be able to
connect, for example, N1: to your 486, N2: to the old 386 down the
hall, etc. For booting the 8-bit, I guess you could have a cartridge
made that would boot the machine and set up the network.

3. A protocol would have to be devised that is simple and generic
enough that it could be used on almost any computer made, as long as
that computer had a RS232 port.

4. We would hopefully be able to use ordinary phone wire for the
network cable itself.

What are everyone's thoughts? This idea, I think, would be a lot more
popular than the new OS. I would love to have one 8-bit in the living
room, one in the kitchen, and one in the bedroom, and have them all be
able to be connected!!! This is what the idea of home computing has
been for years, but computers have been so expensive that you couldn't
use it for keeping a shopping list in the kitchen, keeping your video
tape collection on it in the living room, and still be able to word

process in the bedroom.

P.S. And the network could have a cool name, like GozNET!!!
(Pronounced with a long O as in goes)

My opinion differs... I think that a useful 6502-based multitaking system
is possible. Remember, I work with microcontrollers that are no more
powerful than a 6502, and I've seen (and written) such OS an for some of
them.

>Dudes, we've got 1 major developer left. CSS is essentially a dead
>issue, we should try to drum up support for the damn Sweet 16 otherwise
>it will flop just as much as Chuck Steinman's T-816.
>
>We'll never go ANYWHERE if we consistenly fall back to the lowest common
>denominator

I know what you're trying to accomplish here, but you're skipping too many steps. In
order for people to WANT to upgrade (to SWEET-16 or anything else) they need a REASON
to upgrade. This is why its so important that a new OS works with the stock
hardware. If people use and LIKE a new system, they'll get excited about it and
feverishly snap up everything they can for it. At this stage programs will work, but
users are likely to wish that things happened FASTER, or that they could use MORE
MEMORY, or that they had MORE MODERN CAPABILITES.

Now, if a subsequent version of this hypothetical popular OS were released, and if
it supported the 65816 in ADDITION to the 6502, then people might have a good
reason to upgrade their computer: they'll want to use all of the neat 65816
capabilites that otherwise lie dormant in their new version of the OS.

So you see? Everyone can get what they want, you just can't jump right in and
hammer "buy SWEET-16s!!" into people's heads -- it won't work.

>It is IMPOSSIBLE to write a preemptively multitasking system on a 64K 6502
>system. It is not worth the effort but probably possible on a heavily
>upgraded banked-ram machine, but if the guy has enough initiative to throw
>512K into his machine, why not a friggen Sweet-16?

See above where I talk about disagreeing...

>If someone is too cheap to put more RAM into his system he shouldn't
>whine by not having this OS. Most likely all he does is play games on it
>anyway.

See what I said about needing a REASON to upgrade. The RAM thing is easy, ANYONE can use more RAM.

2141. Saftware to run 8 bit programs on a PC using Xformer 3.0a

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-18 00:00:00 UTC
From: johne2@ix.netcom.com
Message-ID: <410tj0$cl5@ixnews7.ix.netcom.com>
Source record: 89013

Does anyone know where I can find the software that will let my PC read
and execute Atari Dos disks? It implies this is possible in the
Xformer manual, that there is a program called MULE that will do this,
however I have not been able to find it anywhere. Any suggestions?

Thanks in advance/John

I don't have the Atari Connection, however, I do have all issues
of Atari Age magazine from Volume 1, Number 1 (May/June 1982)
to Volume 2, Number 5 (March/April 1984). There are 11 issues
total. If anyone is interested, e-mail me an offer.

In article <143470@cup.portal.com>, jharris@cup.portal.com (John D Harris)
wrote:

> I don't understand what you meant about the 6502 not having indirect
> addressing.

I believe I wrote that the 6502 has no way of accomplishing indirect
addressing except via page zero. As we all know, page zero is a cramped
place with a finite number of addresses. This type of resource limitation
makes traditional use of page zero impossible in the context of the
flexible system I have designed. To compensate, I have devised a system
that can "fake" a pointer using only TWO page zero bytes. Furthermore,
because my system does not use page zero in the traditional way, it is not
limited and will work with any Atari 8-bit configuration.

> Especially in the context of wanting to load programs
> anywhere in RAM. I would think relative addressing would be more
> useful for this purpose. (Though, the 6502 doesn't have it.)

INIRECT addressing is a CRITICAL tool for pointing to data structures in
memory, and it is the only way that pointers can be implemented on the
6502. Some techniques would enjoy relative addressing, but since 6502
doesn't have it, I don't see the point in discussing relative addressing
theory any further.

> I do think that the problem of loading programs into any area of RAM
> could be solved by creating a standard for a relocatable object file

> zero page addresses could simply be allocated to free areas.
> Operating systems for other computers work this way, and it removes
> the burden from the programmer of having to write special code to be
> relocatable.

First, let me say that the 6502 is capable of PC-relative branches of at
most 128 bytes. This, combined with its lack of PC-relative LOADs and
STOREs make implementing TRUE POSITION INDEPENDENT code impossible.
True-position-independent code can be executed from anywhere in memory and
will function properly.

You mention that a possible solution is to create "a standard for a
relocatable object file format." This is EXACTLY what I am doing. I
accomplish this by "fooling" the 6502 and the OS into functioning in a
position-indepenedent way. NOTE HOWEVER, that in the message you are
referring to, I was responding to the question of why CURRENT SOFTWARE
would not be multitasked under the present OS design. My answer, which is

what you are referring to, applied to the NON-POSITION-INDEPENDENT nature
of EXISTING 8-bit software. By suggesting that a new standard be
established, you are agreeing with my argument that "fake" position
independent code is possible, but NOT in terms of the current 8-bit
software available.

> >This goes without saying for anyone designing an OS. However, don't look

> would generally be a very good thing.

Let me say in advance that I don't like the Amiga at all. I understand that it has its
fans, and I think that's great -- best wishes=
to all Amiga enthusiasts. I, however, am not one of them. In all my years in the computer
science field I have NEVER seen a compu=
ter crash as much. This in itself is reason to discount the Amiga. However, Commodore
complimented its crash-prone OS with the fol=
lowing:
1) possibly the ugliest, least intuitive GUI in the world
2) screen flicker, screen flicker, screen flicker....
3) a CLI AND DOS? I guess they couldn't decide. Ever notice how you
HAVE to go to AmigaDOS to do anything useful?

These are the main reasons I dislike the machine. If you disagree with me, that's fine, but
I will not discuss my dislike of that m=
achine any further. I am happy to co-exist with 8-bit users that like Amigas as a fellow
Atari enthusiast.

> crutial stuff regarding low memory is custom chip and legacy OS stuff.

As a matter of fact, Low RAM is VERY, VERY important to Atari 8bit computers. I was hoping to avoid a discussion of HOW the machine uses its extra memory, but it would appear that I am left with little choice but to give a brief overview.

On non-Atari 800 computers with more than 64K (i.e. RAMBO XL upgraded, 130XE, NEWELL upgraded, etc.) the computer accesses the extra RAM via PORTB. This was originally used for joysticks 3 and 4 on the Atari 400/800.

On the high-RAM machines, PORTB allows you to CHANGE the memory that appears in the $4000 - $7FFF address window. Of course, this $4000 byte window is only 16K, and this means that you will need to access the RAM above 64K in 16K chunks.

SO, let's say that you have a 256K RAMBO XL, and you want to acess the high 192K. You accomplish this by BANKING IN 12 DIFFERENT 16K chunks of memory.

You asked, "What is so special about low memory?" In case the answer isn't obvious, I'll elaborate further. Since only SIXTEEN KILOBYTES of high RAM is active at any given time, you MUST have certain CORE operating system services in LOW MEMORY at all times. Things like the memory manager, screen handlers/drivers, task switchers, etc. HAVE to be in LOW RAM because they HAVE to be available at all times.

So say went ahead and threw threw the memory manager in high memory. How's the memory manager going to bank itself in and out if it isn't in the ACTIVE 16K bank to start out with? It can't, and therefore that method will not work.

Hope this clears things up a bit...

MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS WILL BE $1

-Atari 2600 $5.00 min

-Atari 2600 jr, no cables not working

-Atari 7800, no cables $13.00 kurt

-Atari 1200XL no cables $17.00 kurt

-Atari 810 Disk Drive $8.00 dougS

-Intellivoice for Intellivision $4.00 min

-Atari Keyboard Controller $2.00 kurt

-Atari Paddle Controllers

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction is from Sunday, August 13th until Sunday, 20th
at midnight mountain time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be REAL BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent
to follow these rules as stated.

In general, no. These old mags seem to be selling for around
$1 each in most cases. There may be exceptions, but for most of
the magazines, it seems to be roughly the going rate.

2152. 8-bit Disk Conversion to PC Xformer/SIO2PC format

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-18 00:00:00 UTC
From: wadeted@aol.com
Message-ID: <412dqr$7f7@newsbf02.news.aol.com>
Source record: 89024

From: Creative Software Systems
E-mail: DDJT62C@PRODIGY.COM

For those of you who need to have your old 8-bit disks converted to the PC in the SIO2PC and PC Xformer compatible formats, we can do this for you for a nominal fee. Prices are $10 for up to 50 disks and $20 for over 50. We can do double sided ("flippies") and single and enchanced density. Double density is possible, but it is difficult and more expensive to do. We will send you IBM 1.44MB 3.5" disks with your virtual disks PKZipped. Turnaround time is around 1-2 weeks.

We also have a program called the AVD shell that is an easy to use menu driven program to help you manage your SIO2PC/PC Xformer virtual disks. This is an MS-DOS program that lets you select vitrual disks to run with the PC Xformer (instead of using the command line.) and all versions of PC Xformer are supported, including the 3.0/3.2 series with their command line switches. You can also copy, rename, move, delete and store your own info for each virtual disk. One of the more powerful features allows you to view and extract 8-bit files individually from a virtual disk. All densities are supported. Price is $15.95 and you will also recieve several DOS's and utilities in the SIO2PC/PC Xformer format.

We also have a catalog of 8-bit software that has already been converted and checked out to work with the PC Xformer.

For more information call or write to:

2155. OS Listing Wanted

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-18 00:00:00 UTC
From: "Kurt Mosiejczuk"
Message-ID: <4126lu$agp@news.tpp.com>
Source record: 89027

I was reading Mapping the Atari last night (a great reference book) and it referred to the OS Listing that was the commented source listing of the 8bit OS. It seemed like it was available for sale.... In any case, I would like to know if anyone knows how I could get it or if they have a copy they would be willing to part with.... I would prefer an XL/XE version if it is available but either would be great....

Thanks in Advance,
Kurt Mosiejczuk

A relocatable object file format does not require position independent
code. You usually have a header that includes all of the absolute jumps
and data accesses within the program, so the OS can fix the program to
execute anywhere in RAM. From your other comments though, I think you
realize this.

Also, I recall reading an article years ago on how to write self-relocating
code on the 6502. I think the trick involved was jumping to a subroutine
that extracted the program counter from the stack and returned it to the
body of the program. Such a subroutine needs a fixed location, though. I
think. And it's kludgy. But possible.

Brent

Seems to me the OS commented listing is in the Technical Reference Manual,
which is available at http://nimitz.mcs.Kent.edu/~clisowsk/8bit.html.

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <p7Mhbur.lmcclure@delphi.com>
Source record: 89030

In a message dated 8-15-95, Rick Cortese said:

"I believe copyrights run for 50 years & they can be
renewed so we have about another 35 years <whew!> to go."

Since January 1, 1978, bascially Copyrights have had a life of :

(a) The life of the author(s) + 50 years for works by individual(s).

(b) 75 years for "works-for-hire" (i.e., copyrighted by a company).

No renewals are involved. The pre-'78 copyright law had an initial period
of 28 years with an option for one renewal of an additional 28 years.

The mortal Ivo van Poorten wrote:

: If I recall correctly I have pointed out how one can multitask two or more
: programs on a 6502 with each having their own stack etc. a few months ago...

Yes, but even on a banked system, you have to heavily modularize your
code. Just look at how OS-9 does it with data chunks moving all over the
place. Imagine programming for that kind of environment. Without banked
ram you will probably only be able to run 2 small programs, more like
glorified subroutines :) Or you could page to disk like an ancient
minicomputer (like Express PRO! does). It's just so anachronistic and
unnecessary.

My point is, why put such a herculean effort into jumping through hoops
with the 6502 when an affordable 65816 system is around?

: Hmmm... I still own a stock 800XL, and although I wish I had more memory,
: I just can't afford it. Does this make me a gamer???

Do you know how inexpensive dog-slow 256K DRAM chips are these days? I see
already upgraded machines (256K or more) go for not too much money.

Heck, I see Amiga 500s for $75 and they come with 512 or 1 meg memory and
a multitasking operating system. Ram and peripherals continue to come
down in price over time and even for the budget 8-bitter it's worth
taking advantage of this and not just living in a cave.

The mortal Jeff Thomas wrote:
: Okay here's an interesting question. What happens to the screen displays
: if you're running a task switching OS. Each 8-bit program has a screen
: display, what's stopping one from over-writing the others when it's time
: slice comes by? Or even another possibility, will a background task which is
: switched into the foreground to be worked on by the user, be able to redraw
: it's screen properly? Also won't the machine quickly run out of memory
: even if it can find someway of storing all these displays?

My take on this is to reserve all low RAM (and even ANTIC bankable RAM)
as Amigaesque "Chipram". As part of the GUI, each program gets its own
custom screen and memory allocation in low memory where Antic can access
it. Run mainline code in the 24-bit address area of the 65816. When you
run out of low memory, you can't launch any more programs. At 1.79mhz I
don't think you'd run out of gfx memory too often when each screen
(unless scrollable) is no more than 8K a piece.

The Atari resolutions are so low as it is that layer upon layer of window
data on one actual screen is not practical. It would be so crowded and
you'd be clicking windows on top of eachother constantly. Custom screens
that pageflip with a hotkey are better.

: Finally one more, would one be able to continue to use fancy tricks like
: display list manipulation, etc... ?

Most Amiga games and demos disable multitasking to do their tricks. This
is a necessary evil. Screen customization and virtual screens (screens
larger than the viewable area but autoscrolling) could be put into the OS
and standardized so that well-behaved apps could create special screens
and coexist with other programs.

Each program updates its own screen memory area through the OS graphical
layer/manager, no overwriting problems to worry about.

The mortal Michael Ellis wrote:
: On the high-RAM machines, PORTB allows you to CHANGE the memory that appears in the
: $4000 - $7FFF address window. Of course, this $4000 byte window is only 16K, and
: this means that you will need to access the RAM above 64K in 16K chunks.

: SO, let's say that you have a 256K RAMBO XL, and you want to acess the high 192K.
: You accomplish this by BANKING IN 12 DIFFERENT 16K chunks of memory.

If you haven't noticed, I'm not advocating this OS for a banked RAM
system, but rather a linear-RAM 816 memory model.

That being said, there is still plenty of RAM for the necessary low-level
memory management to reserve low memory for screenmemory and then jump to
programs running in linear extended memory. (BTW, I'm just assuming that
Antic will not be able to look at 816 extended memory, I don't know this
for a fact.)

It is these very banking gymnastics that is the basis for me NOT
suggesting that the OS work on banked ram 6502 systems.

Not to mention the myriad of banked memory bit schemes being used that
you'd have to take into account...

I really think this OS is self-screening. Those who want an 816 want
something that takes advantage of the new CPU's features. Those who
don't want the 816 probably don't need the new OS and are just curious
and are getting in the way by suggesting it work on L.C.D. configurations.

I don't see the logic in releasing a 65816 upgrade if the OS isn't
updated at all. That's like MS-DOS 5 on a 386 never touching protected
memory and continuing to use the segmented schemes (essentially turning
it into a task switching 8088 with a faster clock). Hardware and
software go hand in hand.

Summary of Atari 8-bit's an emulated 8-bit Atari's:

Atari 8-bit computers were produced between 1979 and 1987. The
major models released were the:

400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
1200XL - 64K, 1200XL OS, GTIA graphics
```

600XL - 16K, XL OS, GTIA graphics
800XL - 64K, XL OS, GTIA graphics
65XE - 64K, XL OS, GTIA graphics
130XE - 128K, XL OS, GTIA graphics
XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)

All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.

Branch Always Software are the creators of:
ST Xformer (Atari 8-bit emulator for ST's), Quick ST, Quick Index, Gemulator (Atari ST emulator for PC's), and PC Xformer (Atari 8-bit emulator for PC's).

ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit machines. Very limited. Now public domain (used to be commercial).
PC Xformer 2.0 and 2.5 released for IBM PC machines. 2.0 is limited and supports only 800 OS. Both public domain (were always PD).
PC Xformer 3.0 released for IBM PC machines. Supports all OSes, 320K RAM, and best of all, player/missile collision detection (which MANY games use!)

Graphics:

The Atari has maximum resolution of 320 x 192 (standard, non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also supported. 40 x 24 x 256-character (128 normal, 128 inverse, character set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen modes.
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection (which is not supported by the PC Xformer 2.0 and 2.5 and ST Xformer programs).

Sound:

Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the
comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for
IBM / MSDOS based computers, the PC Xformer 2.0 (XF2 for short). Many
people in the 8-bit community had gotten, well, fed up with the XF2-based
questions which did not pertain to them, or to the really dumb questions
which were in fact understandable to new or rusty Atari 8-bit users, but
had just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions. Now it's becoming a fairly good reference (and got me the job
of writing the commerical 3.0 release's documents!).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
supplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0,
and 3.0, the first commercial release, have been released. It is assumed
that the reader has the latest versions of PC Xformer (2.5 or 3.0), although
if you have 3.0, I must say, those documents are great! (If you don't get
the joke, look at the name of the author of the manual, and look at my name.)

---=== Xformer Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System. Be sure you're in 800XL or 130XE
mode. (130XE mode is only supported by XF3.0, not 2.5, but there is
no real difference in the operating systems.)
A.2.2) It may not work under the XL/XE Operating System (rare cases), switch
to 800 mode.
A.2.3) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.

A.2.4) It might be a BASIC game! Be sure you're in BASIC and use the BASIC
"RUN" or "LOAD" (and then "RUN") command. Also, be sure it works
with the BASIC you have. Some programs only run in BASIC XL or XE
(which are both cartridge-based BASIC's not currently supported by
the Xformer), and some run with TurboBASIC XL (disk-based).
A.2.5) It may just refuse to run on the emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.5. You might have to shell out the $29.95 for 3.0!
A.4.2) (See Question 2).

Q.5) How do I exit XF and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR
are both DOS boot-disk-images and are both in the XF25.ZIP file or
on your XF3 disk).

Q.7) How do I use MSDOS files with XFormer?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XFormer which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XFORMER from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XFormer. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.
A.7.3) If you can, use the MSDOS program ATARIMG, which is much like
S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XFormer and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the

XFormer (and the S2PC program mentioned above). .XFD files are used
by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC
Xformer (XF2,XF25,XF3).

Q.9) What's SIO2PC?
A.9.1) Refer to the XFormer and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XFormer does) as a single file all alone
in its own disk. It also currently allows Print-Thru (all access to
the Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced XFormer users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS (4.50 and 4.53) presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)

[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XFormer, it's much quicker to just copy one .XFD or .ATR
to another).
[K] Make binary file: saves memory and makes it binary-loadable. See [L].
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)

disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN

that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS)
E: editior - readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
G: graphics - writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
K: keyboard - readable. This is just the keyboard. Input from it is not 'echoed' back like with the "E:ditor".
M: multi-mouse - readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
P: printer - writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by

using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
W: Windowing (screens) - readable, writeable. This is a graphics
8 graphical windowing driver (rarely used, unfortunately!).
It must of course be loaded as well.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference

Manual). (As of Jan. 7, 1995, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with

SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft

of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is

format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?

____
[note:] Someone please give more details or corrections here! Thanx!
~~~~~~~
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
~~~~~~~

board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images or PC Xformer XFD disk images
other than using Disk Communicator 3.2 on my Atari! I mean, both files
are disk images! They're both on my PC's hard drive! <cry>
(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)
A.3.1) Yes! There's a new IBM program out called DCM2DSK.
(Why "DSK" and not "ATR"? To keep people from getting confused with
the ATR-8000(?)) The current version is '2' and it's available at
UMich's archives and probably elsewhere. Filename: "DCM2DSK2.ZIP" in
the SIO2PC directory.
A.3.2) There's also a new program which converts DCM's to XFD's. I need to
look at it myself first before I can describe it (or someone help
me, please?)

---=== Where to get or FTP files mentioned in this FAQ: ===---

The PC Xformer 2.0 and 2.5 can be downloaded from the "ftp.clark.net" FTP
site:
Directory/file-path: systems/msdos/emulators/xf25.zip (or xf2.zip)

PC Xformer 3.0 can be purchased for $29.95 (prices may vary) from:

2166. 8bit emulator. how do I use it?

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-19 00:00:00 UTC
From: ropero@ix.netcom.com
Message-ID: <413glb$qbv@ixnews3.ix.netcom.com>
Source record: 89038

hello, I have been trying to use the emulator for the 8-bit
on the ibm pc.
how do I load software that does not use dos? (autoloading software)
where are some ftp sites that have atari 8bit software?
so far I have not gotten anything to work on the emulator except
encounter. but even that does not have any sound.

If anyone has any software that works for the emulator, please
email me what you have.

sincerly, rob rope

email: ropero@ix.netcom.com

In article <4148mr$fob@nnrp3.primenet.com>, krishna@primenet.com (Glenn Saunders) writes:
<< Then why are you even contributing to this thread? I am frustrated when
people come off as almost DISCOURAGING progress as if it is anathema to
their cozy little nostalgia-fest.

If you are happy with things as they are, so be it, but why stumble into
these discussions when they are of no consequence to you?
>>

Hmmm....since I'm asking you about that development kit, I'll pass on my usual scathing response and just answer the questions you pose.

- "Then why are you even contributing to this thread?"
Since this is not a private discussion, and there is no moderator for this group, I thought I could pretty much get away with voicing my opinion. Apparently you liked my post enough to rate is as a 'contribution', so it couldn't have been that awful!

- "I am frustrated when people come off as almost DISCOURAGING progress"
I don't think that my comments are likely to discourage anyone from writing any software, or from using that software if it becomes available. You certainly don't sound discouraged; if anything you sound more determined than ever.

- "as if it is anathema to their cozy little nostalgia-fest."
I can't disagree that I'm nostalgic about the 8-bitter. Since I make my living writing software, I just can't afford to treat it as a profitable platform. There may be a limited market here, but I don't think even your hypothetical multi-tasking OS would be able to handle the processing that my work involves these days.

- "If you are happy with things as they are, so be it, but why stumble into
- these discussions when they are of no consequence to you?"
I guess I 'stumbled' into reading your posts just the same way you 'stumbled' into posting them. Originally someone asked if anybody would be interested in a new OS for the 8-bitter, and I did not respond at the time because I wasn't interested. Reading your posts I briefly became interested, and finally decided I was more interested in the discussion than in actually seeing this OS.

Since I own a good heap of Atari 8-bit stuff and have been involved with the Atari since it first became available, I'd say it was of some consequence to me, as it is to anyone else who reads this group.

Honestly, if you're upset about someone's opinion, how are you going to react to bug reports when you get your OS finished? Or are you just going to release it bug-free? And what about the guy who posted saying he would like to see certain enhancements and fixes to the current OS instead? Was he not 'DISCOURAGING' enough to receive your notice?

Bert Whetstone
- Happy Atari owner but now even less interested in a new multitasking 8-bit OS

Jeff, the way screens are handled in at least the multitasking stuff I've seen is each program get's its own slice of screen just like it's working in full screen mode. It's the job of the OS to decide what slice is brought to the for front. For instance, let's say you did something like wrote a WP & telecommunication program, each of which was designed to run in a 16k bank. Each would have it's own screen memory, but this would not be directly displayed. The OS would have a display area, maybe even in low ram below the bank switching area. The new OS, assuming it is just an extension of the existing one, would probably bypass the existing OS routines completely doing it's output directly to its display memory. Essentially what would happen is the extended operating system would have flags in memory telling it what portion of the screen to display, something like: Lines 0-10 of program in bank zero, lines 11-15 of program in bank #1, ...
If you didn't want to do anything practical<g> like use a DLI for the switching, you'd just do a brute force series of moves during the VBI to draw the displayed screen. As far as each subprogram goes, it thinks it's writing to a full screen.
Rick

>ussr.tar must be from another Atari planet.

I can explain part of it... whoever uploaded them uses Unix. the tar
part refers to a unix foramt for collecting a bunch of files into one
file, without compression. The compression is usually done separately
-- that's the gz part. They were compressed with the gzip program.
The text descriptions are probably contained _within_ the tar. :-/

But of course none of this does any good for normal Atari people.
Neither tar nor gzip are available on the 8bits, of course.

I'll see what I can find out....

A quick analogy (this is my "VERY SHORT" post I said I'd be making at the end of that last HUGE one ;))

OK - you people who are... not necissarily "against", but very uninterested in this new environment:

Say this environment is NOT actually an OS.. say it's, as I hope it will be and as I described it in my last post, SIMPLY something you load before you can run any of the newfangled applications.

Now, DON'T say that you'd not live with this WITHOUT being able to HONESTLY say that you NEVER use TurboBASIC XL or even BASIC.

Think about it.. if I want to run "program.tbs", I must first load "TBXL.COM". With MY (and probably many others') idea of how this "OE" (Operating Environment) should be done, NOT as a "new OS", it would be the SAME. If I want to run "game.app", I must first load the environment in which it runs.

It'll be like <gag> MSWindows 3.1- if you try to load "paint.exe" it'll complain: "You must run this from Windows" and quit.

Satisfied?

Source record: 89045

My 2c:

I'm EASILY discouraged. (Hence the current "back-burnerness" of about
3 games I'm working on.)
I'm interested not in a new OS but instead simply an MSWindows-like
"thing". Note: I hate Windows. End of disclaimer. :) I'd just
rather have something you load than something you plug in.. something
you can quite out of and be able to run old software without rebooting..
I have a HOME PAGE dedicated to the ideas of task swapping, as well as
PAGES and PAGES (paper) scattered all over regarding ideas for TUIs,
GUIs, CLIs, windowing, task swapping, etc.
I'm part of the (currently too quiet) ADOS group (whose name I STILL don't
like since it says not only "OS" in it, but also "DOS", even though it's
not "D for Disk"). This group was brought together, what, almost a year
ago probably, to discuss and collect information and ideas on a new
GUI environment or OS. It was "led" by David Wyne Davies from the UK
and.. er... that user group. (Good job Bill, I'm surprised you didn't
forget his name! ;))

Anyway, that's MY status. ie, I consider myself a big part of this
"New Environment Movement" who see the potential of the Atari. In fact,
we (ADOS) saw the potential of the Atari to do these types of things WELL
long before FTe even MENTIONED Sweet16.. but now that I've got one, and
that I know it's specs, I'm even more positive than I was at first that
THIS IS THE WAY TO GO.

I WILL however RESTATE my earlier thoughts regarding compatibility:

If it going to be GOOD, MODULAR and UPGRADABLE, it should be handler
by some sort of VECTOR SYSTEM. One does not call "$XYZ4" to open
a window >IF< the "open a window" routine is STORED there... one
calls it THROUGH a vector. When version X.2 comes out of the "OS",
old programs should STILL be able to ask it to open a window WITHOUT
CRASHING even though the "open a window" routine is now stored at
"$1BCD"!!!

Taking this a further step, there should be different versions of the
OERs ("operating environment routines") for different setups...
perhaps just the two main setups: 6502 vs 65816. A problem will
arise when "PhotoShopXE" comes out which uses 65816 instructions,
but otherwise, everything else can be written in 6502, calling the
OE routines through vectors... The ACTUAL OERs MIGHT OR MIGHT NOT
BE WRITTEN USING 65816 INSTRUCTIONS- this will depend on which set of
OERs you have loaded...

INOTHERWORDS, Joe Schmoe with the 6502+256K can load "OER6502.COM" and have it's memory manager set up for "Brand-X 256K banked memory".

He'll then load "schmEDIT.COM", a 6502 program, calling OERs through vectors. It will run.

THEN, Bob Schmob with the 65816+4MB can load "OER65816.COM" and have IT's memory manager set up for "4MB linear memory".

He'll then ALSO load "schmEDIT.COM", a 6502 program, calling OERs through vectors. It will ALSO run.

What the hell's the difference? Bob Schmob will have more space and the OE routines will run faster (and possibly be more configurable, etc.. whatever).

Now, AGAIN... if 6502-owning Joe Schmoe tries to run a 65816 application for the OE, it won't work.. duh.. obviously.. But, not only with Bob Schmob, with his newfangled Sweet16 be able to run "PhotoShopXL'816" and have the OERs run faster, BUT the whole PROGRAM will be more powerful since it ITSELF is a 65816 application!

GET IT!? Good!

----- FINALLY: ON ANOTHER ASIDE.... -----

(Sorry I'm making this so long-winded...)

NOT ONLY can you load "OER6502.COM" or "OER65816.COM", but you can also load versions which are VERY small (not very configurable, not very flashy.. say "text only" mode but still windowing and stuff) as well as versions which look completely different ("OER95" or "OER31" or "OERSystem7" or "OERStep" or something...)

Now, to reiterate this idea in the final form I stated earlier:

each part of the OE... each "R" (routine) of the thing, can be a different monster altogether.. you chose which type of "Windows" to have, which type of "Buttons" to have... where and what type of "Menus" to have, etc.

When you load "OER.COM", it simply goes through a list of "stuff to load" and viola... all of these routines are loaded... if I want my next session to have ROUND windows instead of square ones (that's taking it a little far, I know ;)) NOT ONLY >CAN< I DO IT by simply loading a different "Windows" routine file >BUT< ALL OF THE SOFTWARE SHOULD NOT CARE! ~~~~~~~~~~
~~~~~

ANYWAY... any questions? Mr. Ellis, TRY to conform at least a LITTLE to these ideas! ;)

... and again, I'm SO TOTALLY FOR this idea, BUT I'm NOT for multitasking.. Hell, I live without it anyway.

Hmm.. see my next (VERY SHORT) post
~~~~~

> -rw------- lenn 44679 Aug 13 05:38 ./8bit/Demos/wfmh.tar.gz

OK, I found out more...

First of all, these were apparently uploaded by Tomasz Tatar
<tatar@student.uci.agh.edu.pl>. My guess is that he intended for Jody
to untar them and put the individual files up.

Here are the listings for each one. BTW, a .Z extension signifies another
Unix compression format ("compress") similar to gzip.

ussr.tar.gz:
alf.com.Z
alf.txt
alien.com
alien.txt
axelfoll.com
axelfoll.txt
duksap.com
duksap.txt
falcon.com
falcon.txt
landscap.com
landscap.txt
moonshad.com
moonshad.txt
perestrk.com.Z
perestrk.txt
skynetwk.com.Z
skynetwk.txt

wfmh.tar.gz:
button.com
button.txt
cosdemo.com.Z
cosdemo.txt
revenge.com
revenge.txt
swing.com
swing.txt
what.com

what.txt

other.tar.gz:
bdemo.com
code3crn.arc
code3crn.txt
osadnicy.dcm
osadnicy.txt
supak.com
supak.txt

As I type this, I'm uploading the Atari-readable files to umich. No
tar, gz, or Z for you to worry about.

Maybe it's time to start thinking about writing "gunzip" and "untar"
for the Ataris....

In a message dated 8-15-95, Rick Cortese said:

"I believe copyrights run for 50 years & they can be
renewed so we have about another 35 years <whew!> to go."

Since January 1, 1978, put simply, copyrights have had a life of :

(a) The life of the author(s) + 50 years for works by individual(s).

(b) 75 years for "works-for-hire" (i.e., copyrighted by a company).

No renewals are involved. The pre-'78 copyright had an initial period of
28 years with an option for one renewal of an additional 28 years.

Rob Funk (rfunk@magnus.acs.ohio-state.edu) wrote:
: Maybe it's time to start thinking about writing "gunzip" and "untar"
: for the Ataris....

OH I've been thinking about doing 'gunzip' (Which basically uses the PK-Zip Inflate/Deflate algorithm), for the Atari 8bit for some time now. It is quite do-able. Although one will need to have an enhanced memory 8bit to be able to 'gunzip' files. The only thing that I lack is the time, to sit down and modify and test the main inflate algorithm used. I have a printout of InfoZip's 'unzip' program which uses the inflate algorithm; it is quite marked on with red, black, and blue ink. (grin)
I planned on using CC65 (Cross-compiler platform for Unix) to develop the actual 8Bit program, so it won't be as fast as is possibly. By sticking with C, one doesn'T have to worry and fuss about all the various data-structures used in the algorithm.
As far as 'untar' for the 8bit, that should be quite simple to do. Its nothing more than a header-structure here and there, followed by the complete data for the file.

Hopefully I'll get enough time out of my schedule to sit down and actually produce these two. Then again, maybe I could just ignore my other projects: admining a subnet of Unix machines, porting NetBSD to the IBM-RT, and producing a unique mud (DIKU-style).

I just bought a $2 ape face adapter (direct Atari 13-pin SIO plug to centronics printer) today at a thrift store. I plugged it right in to my Atari 800, but when I tried to print something out in BASIC nothing came out. Is there a special handler for this beast? Or is mine just broken? I don't feed too sad if it has died, considering what I paid for it.

I also note that it doesn't stay in the printer port AT ALL. I'd have to tape it for it to stay, and even then I wouldn't trust it very much. Does anyone else have one of these?

: Bruce Willard
: bwillard@mindspring.com

Surprised no one else mentioned this in this thread yet, but the 5200 IS
NOT compatible with the 8-bit computers. It's apparently very similar to
an 800, but not quite the same as far as memory addresses and whatnot, so
that 8-bit carts won't work on a 5200 and vice versa.

The other major drawback to the 5200 is it's shitty controllers. They
were analog, not digital, and have a tendency to break and of course
these days it's very difficult to replace them. Even if you do find a
5200 with working joysticks, the sticks are a pain to use: tiny fire
buttons on the side of the controller, and a non-centering joystick.

More info on the 5200 can be gleaned, as mentioned, on Greg Chance's
Webpage. I have a link to it on mine (URL below).

You answer your own question. :-)
Since it's out there "running rampant", it would be useful to be able
to decode it. Notice I didn't mention writing programs that actually
encode in tar and gzip formats; we have other standards (ARC) for
that.

>Sheesh! I'm still contented with *.ALF!

On the Atari, I'm content with SDX's built-in ARC. But in unix I
always use tar.gz, and in MS-DOS I always use ZIP. Just like we have
programs that translate text between different EOL conventions (SDV is
the best program for that I've ever seen on any platform!), we should
be able to read files that were compressed with "foreign" compression
standards.

Not compatabile? I wouldn't say that! I've got a 5200 version of
Countermeasure (which was never released, as far as I know, on the
8-bit). And it's a disk file the runs perfectly on my 800xl. It came
on a disk that I got when I bought a ton of 8 bit stuff off of
Compuserve a couple of years ago.

RC> process in the bedroom.

There is already a multi-tasking, multi-user, multi-station network devised for an INTeL 486 that uses RS-232 terminal protocols. It is called by many names: LINUX, MACH, FREEBSD, MINIX. All that is required is to purchase a multi-plexer box such as a DIGI-BOARD or an INTELLI-PORT. Then, you load up a terminal program on each of your 8-bit PCs and run an RS-232 cable from the 8-bit PC to the RS-232 port on the box. As RS-232 is good for something like up to 200 yards, you can even run lines to your neighbor's house and put a remote terminal there, as well. Unfortunately, all of your 8-bit PCs will be slaves off of the 486 running UNIX, but it is a start (i.e. multi-station with a 486 server). What you would then need would be a method for the 8-bit terminal to "swap out" the terminal and go into "local mode" for word processing, etc. Hmm... it might be doable if you had something like Keith Ledbetter's "EXPRESS!-TERM" on cartridge. Perhaps you could "swap out" the cartridge, run TETXPRO, "swap in" the cartridge, and run the network terminal, in the same manner that BASIC uses its MEM.SAV file? Hmm... I don't know if it is possible to "hardware disconnect" without keeping a virtual circuit busy. Hmm... it might require doing your own specialized line polling on the 486 side. I would think that it is doable. UNIX is highly customizable. Multiple terminals would be the place to start, then you could write drivers to allow for the

use of remote disk drives on the 8-bit PCs locally, like the old ALTOs networks used to do. Hmm... interesting possibilities, there.

> it into a task switching 8088 with a faster clock). Hardware and
> software go hand in hand.

I don't know how many different ways I can put this, but I'll try once more. To write an OS for this small market is already a selfless act, but to write an OS that only 2%-5% of the ALREADY TINY market could use is ABSURD.

It would appear that we have a chicken and egg problem here. You are saying that the 65816 (the chicken) should come before the OS (the egg). I am saying the opposite because people (including myself) will NOT buy USELESS hardware. And let's face it, at this point in time the 65816 IS useless hardware.

If people used an OS that worked fine but would benefit from more power, an upgrade PACKAGE that consisted of a 65816 and a version of the OS that would take advantage of would be a viable product. In this case you not only get a more powerful CPU but also the software you need to take advantage of it. This is common sense, really.

I hope this clears things up...

He should have said "not fully compatible". The 5200 has
a 1K OS, no PIA, and several of the memory locations are
moved. Also you need to replace the controller code to
use real joysticks.

It's been done with several games.

I don't have an answer for you, Itay, but I agree that the internal
speaker should have been left internal! With, of course, the addition of
the ability to turn it off.
I miss having that "fifth voice" coming out of the machine itself.
It's not the same with it coming out of the speaker.
Back in the old days (heh), you could turn your TV/Monitor down,
and still get information through the keyboard speaker. Why? Well, for
instance, you might have a program that takes a long time to do something.
So, you shut off the TV/Monitor, and let it alone. Then, the keyboard
buzzes to let you know it's done.
If someone has a relatively easy way to add the speaker back in,
I'd be interested in it.

BTW, speaking of upgrades, does anyone know the approximate
release date of the Mars8?

Yes, I know - this is my point. ARC works fine for encode & decode -
why isn't it possible to encode a file as .ARC and *then* upload it to
a &#$%@ *nix system - what is the difference there (other than not
adding another useless step)?

The software that is/was written for the Atari8 had to originate (ok, *most*,
I'm sure there are exceptions) on an Atari8 - why not encode it there and
then ship it over to ftp.stuff.com - I suppose I could, if I tried *real* hard,
store my MS-DOS files under Mac StuffIt, port the Mac pgm under some sort of
680x0 emulator, so I could store my files on an Apple (If I had one, that is...)

<aargh>

As I recall, the idea of computers was to make things *easier*...

ARC is not foreign to Atari8 - I seem to be able to find any MS-DOS pgm
I want on *nix boxes with .ZIP extensions - why should I store Atari
under .tar?

Source record: 89070

Just to put in my .02 again, I also had several programs converted to the 8-bits from the 5200. One of the more fun ones was Pitfall II, but it locked up on the 8-bit. I built the RF/PS converter as per Greg Chance's instructions and found a power supply and my 5200 works. I have only been able to find one controller so far, and it was in bad shape. I was able to jury-rig it so it can be used, and am now playing Pitfall II the original.

The mortal Michael Ellis wrote:

: If people used an OS that worked fine but would benefit from more power,
: an upgrade PACKAGE that consisted of a 65816 and a version of the OS that
: would take advantage of would be a viable product. In this case you not
: only get a more powerful CPU but also the software you need to take
: advantage of it. This is common sense, really.

I just have sympathy for the programmer here. It's wishful thinking enough that he would follow through with anything. That he would write it in two vastly different environments is even less likely. For it would likely require a total from scratch rewrite for the 816. A banked system would be a mondo kludge and would probably burn him out in no time. If he can do it, more power to him. If he can do a banked system with all the functionality of an 816 system, my hat's off to him. I just don't see it as practical, and a 64K system, that's just a pipedream IMO.

Luis,
Yes. As a start, you could somehow find Michael Current's Internet address.
He hangs out here in the Comp.sys.atari.8bit usenet group, and he can post
(E-mail) you an entire list of places that support the Atari 8-bit computer.
Presently, I don't have his Net address, but I can name one place to look...
Best Electronics
2021 The Alameda, Suite 290
San Jose, California 95126-1127
Phone:(408)243-6950
Also, somewhere on this newsgroup, if you Browse by topic, you'll find a
topic that says something to the effect of 'Atari 8-bit SIO cables for $1.50???'
Reply, and choose the send E-mail option to the original poster of this article.
His name is Ralph Maddox. He owns American Techna-Vision, yet another purveyor
of 8-bit products. He has 1050 power supplies dirt cheap. Just E-mail him your
name and address, and he'll send you a catalog for free.
I hope this was helpful. If I can find Michael Current's Net address,
I'll E-mail it to you.
Later,
Jason Hedrick

Source record: 89077

To connect "most any old RS-232-bearing modem" to an Atari, you'll need
an Atari 850 or ICD P:R:Connection (the two cheapest ways to go, I think).

The only "direct-connect" modems for the Atari were slow 300 and 1200 baud
modems.

Good terminal software for the Atari includes:

IceT - good, reasonably fast (9600bps), flickerless-but-small 80 column
VT100 terminal with X download
FlickerTerm80 - good, fast (14.4kbps), flickering-and-bigger 80 column
VT100/ANSI terminal (with bold/bright)
BobTerm - very good, fast (14.4kbps), standard 40 column (or slower(?)
80 column with the XEP80 unit and a 2nd monitor) VT52 terminal
with X/X1K/Y/YBatch upload and download (as well as a couple other
less common protocols)

To survive on a BBS or Unix box, you'll most definitely need good 80 column;
especially when dealing with the general BBSing public (who are on the whole
usually quite a rude group of little "conform-to-PC-or-die" folks, unless
it's specifcally a "Platform-XYZ" (nonPC: Amiga, Atari ST, etc.) BBS- of
course it DOES obviously simply depend on the Sysop's and userbase's
personalities).

There's also a (quite good, so I've heard) stand-alone Z-modem download
program.

All three of the above programs are disk-based (heh- conform to floppies
or die is about all it is on the Atari 8bit :)). Two great DOSes to keep
in mind include the menu-based, very compatible (with older/general software)
MyDOS 4.53 and the CLI-based, powerful, sometimes incompatible SpartaDOS 3.2.

All of these programs are available via FTP at: atari.archive.umich.edu
under "atari/8bit".

Can't get on? FTP to: amiga.archive.umich.edu instead; be warned, though:
the "cd" command is messed up.

Got gopher access? Gopher to: gopher.archive.umich.edu and go to
~"Merit Software Archives", then to ~"Atari Archives", then to "8bit"...

Finally, if you need to get a modern DOS and happen to have a DOS (like
Atari DOS 2.5 or 2.0 or something) already, you'll need DiskComm 3.2
to transfer the bootable disk images of the DOS(es) into actual bootable
DISKS.

PS- If you've got a PC (why are you using the Atari for a terminal? <jk!>)
seriously consider getting or building an SIO2PC cable so that you can

use your PC as disk drives, a printer and even now a modem for your
Atari. (ie, turn your PC into four 16MB-capacity, double density disk drives,
a printer interface, and an RS232 modem interface!!!)

SIO2PC is also available (including instructions, in one of the older
versions (3.19 is the latest version of the standard software)) at UMich,
as is "Atari Disk Emulator" by Steven Tucker here on c.s.a.8- it's a nicer
program and is the one capable of RS232 access on the PC (as well as direct
access via the Atari (not the PC or with special software!) to the PC's
disk drives!!!)

Good luck!

Well, I did a small unzipper in C (Lightspeed C) but bumped into a lack of
memory. Same happened when I redid the thing in Action! a few months ago.
So.. it should be done in assembly. As for the memory requirements of
the inflate/deflate engine, I think it could be done on a stock atari 8-bit
with 64KB of RAM. It'll need 32KB for the 'sliding' window and some kilobytes
for the huffman tables. When you use CC65 it will definitely not run on
a stock atari.

But the problem with this is you have to own a Intel Computer capable
of running linux, mach,... I would like to see a network that could
use a 286 as the server!! The other problem is having to buy a
digiboard, which is a little expensive for a home network.

Does anyone know if you can daisy chain RS232 signals?

I got to thinking this past weekend, and thought that if it was
possible to be daisy chained, then could we run some type of TCP/IP
over it? This would allow us to use a lot of tools that are already
invented. (I would love to be able to telnet into my Linux box!!)

[...]
>As I recall, the idea of computers was to make things *easier*...

Right, so when somebody has their some Atari stuff stored on a Unix
machine already (because that's what they use for everything else),
they start to tar and gzip without thinking, because that's easier for
them (and better in some ways, which doesn't matter if you can't
decode it).
But it's a BIG pain for everybody else.

I'm certainly not saying that we should start using tar.gz for Atari
stuff, just that we should be able to decode it.

Besides, there's a lot of text out there that's gzipped that it would
be useful to be able to read.

>ARC is not foreign to Atari8 - I seem to be able to find any MS-DOS pgm
>I want on *nix boxes with .ZIP extensions - why should I store Atari
>under .tar?

I'm not saying you should, I'm saying you should be able to decode
something that's already tarred!
Let's see, there are MS-DOS and Unix programs to decode ARC, ZIP,
tar.gz and tar.Z, but of those the Atari can currently only decode
ARC.... and you LIKE this? I guess now I know how to hide something
from you. :-)

H E Y E V E R Y O N E ! ! !

Did it EVER occur to you the following:

Tomasz wanted to send the files in a few BIG chunks, not a dozen small files
Tomasz did NOT want to ARC the files because then they'd sit at UMich
as huge ARCs and 1/2 the people would complain "ARCs too big!" and
others would be fine with it "it's ARC, who cares?" :)
Tomasz expected them to be unGZ/TARed before "released" at UMich

That's what I think- and since he had access to Unix, and perhaps no other
machine "in between" (ie, he couldn't ZIP, as if he could trust that the
FTP keeper HAD a working unZIP for Unix), he used the Unix box to stick
everything together and compress it.

Anyway - >I< feel it's advantageous for us to support (at LEAST when it
comes to undoing- this from a big fan of: JViewXL, MODPlay, WAV2DIG, etc.)
other "standard" formats.

We can't always trust others (say on LOCAL (NON-ATARI-SUPPORTING) BBSes!)
to conform to OUR old, sometimes inefficient file formats! Sheesh!

If there is a MODS FAQ, I've never seen it. I don't
think it exists. To answer your question, yes, you can add
a Monitor output jack, but, you must remove the TV switch.
Under it are the connections for the Monitor Jack. Just
solder the Jack in, cut a hole in the case and go.

John; as long as no smoke came out of the power supply, it may be fixable. There were several designs for the 9VAC transformer cases, some of them had the rubber feet covering the screw holes, some of them were glued. Figure out how to take it appart & you'll find a small fuse soldered on the transformer's secondary, replace it & you should be OK. If that fails, just buy a tranformer rated at 9VAC/3 amps & use the old cable to go to your Atari. Of course you should put something like a 2 amp slow blow fuse in there just in case there is really something seriously wrong with your Atari.

I understand that the latest issue of NAU came out
a couple of weeks back. However, I don't seem to have
received my copy.
I have changed address and renewed my subscription
recently but they responded to orders that were in the
letter containing these details.

Has anyone else had a problem in getting hold of the
new issue or is it just me? I've tried phoning the
office but I can't get any reply (not even the
answerphone) - I guess they must be on holiday.

Anyone know anything for sure?

Thanks for any help, Joel.

If there is a MODS FAQ, I've never seen it. I don't
think it exists. To answer your question, yes, you can add
a Monitor output jack, but, you must remove the TV switch.
Under it are the connections for the Monitor Jack. Just
solder the Jack in, cut a hole in the case and go.

This will not work. The 600XL does not have all the components of the
video amplifier installed. You can install them to get 800XL quality
video, but the better way to go is Ben Poehland's Super Video 2.1 for the
600XL. I've done this, it's tedious, but it's worth it. Probably no more
difficult, really, than restoring stock video to the 600XL.

interesting FAQ, and advert :^)

>***SECTION 10: IOMEGA ZIP vs SYQUEST EZ135
>SyQuest has released a new drive called the "EZ135" (formerly known by
>its code name, "Roadrunner"). This drive costs ~$230 for an external
>version (~$200 for an internal version) and uses ~$25 cartridges that
>store 135-MB each. EZ135 weighs about 2 lbs (twice as much as the
>diet-conscious Zip), but is also about twice as fast.
>There are many mixed messages about which drive will ultimately prevail.
>However, I personally feel that the Zip drive will be the winner for
>several reasons. Here's why:

>* The Zip drive is cheaper. Zip costs $200 for external, while EZ135 is
>~$30 more.
for a measly $30 you get twice the speed and an extra 30MB. How
can the ZIP compete with that?
Furthermore, the Zip drive is now available
internally from >Power Computing and soon as an end-user installation kit, and
chances are >it will cost considerably less than the EZ135's internal price of
$200.>* Zip cartridges are smaller, lighter, and more transportable. EZ135's
>cartridges need to be stored in the same sort of padded carrying case as
>"standard" SyQuest cartridges, making then considerably more bulky to
>transport. As a result, you'll likely see less of them being used with
>portable computers and, consequently, with desktop machines.>* Zip already
has a substantial market lead over SyQuest. Historically >speaking, the Mac
market hasn't had much in the way of brand-loyalty. >SyQuest drives became the
predominant standard not because of any >outstanding features, but simply
because they were cheap in comparison to >the more expensive Bernoulli drives.
Similarly, the Zip is cheaper than >EZ135.
but if people compare the speed, storage space? an extra 300MB per 10 disks is
nothing to sneeze at!
>* The Zip is being offered as optional equipment in
Power Computing's Mac >clones (and hopefully -- eventually -- Apple's own
products), whereas the >EZ135 is not. This has the potential to give the Zip
drive an even larger >market share.
>* Though EZ135 is faster, Zip is already fast enough for the majority of
>users. QuickTime movies, sound files, and similar time-intensive files
>play just fine from Zip. Only a comparatively few users will actually
>_need_ the additional speed that EZ135 offers, and when you consider this
>in relation to everything else, the EZ135's speed becomes a
>not-so-important factor.

what 'everything else'? people may not _need_ the speed, but I think they will
want it :^)
>* EZ135 cartridges hold about 30-MB more data after formatting,
true, but >is that enough to justify a more expensive, heavier drive?
I generally don't walk around with my drives :^)
I don't think >so. Again, the fact that the Zip is so easily transportable
makes it the >better drive, regardless of the data storage capacity. If
SyQuest's new >drive were to hold, say, 200-MB or more it would be a
considerably >different story.
>* People may be angry at SyQuest for "holding out" on the community. More
>than a few users have wondered out loud why SyQuest didn't introduce the
>EZ135 before Zip came on the scene. The most logical answer is that
>SyQuest was making so much money off its other, lower-capacity drives
lower capacity? only the 5-1/4" 44MB and 88MB, everything else is over 100MB

>that they didn't want to rock the boat by introducing the EZ135. Only
>when Iomega started severely cutting into SyQuest's market did SyQuest
>respond with the EZ135. In short, it seems that SyQuest was more
>interested in lining its own pockets instead of advancing the technology.

I have in 850 Interface (in GREAT shape - looks new!) with power supply
and SIO cable that I would be interested in trading for other Atari 8-bit
equipment.

Here are some of the things I would be interested in:

Atari Touch Tablet
Atari XEP80
certain XE game cartridges (primarily Crossbow and Crime Busters)
and other stuff as well (including classic video game stuff, such as
items for the ColecoVision, Intellivision, Atari 2600/7800)...

make me an offer!

David

2230. APE FACE

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-21 00:00:00 UTC
From: Brad Rogers <brad@pianosa.demon.co.uk>
Message-ID: <30392b54@pianosa.demon.co.uk>
Source record: 89102

Whilst reading the usual rubbish I find here, Eric Sokolowsky wrote something interesting to All about APE FACE:

Hi Eric,

[Ape Face printer adaptor]
ES> came out. Is there a special handler for this beast? Or is mine just

To get anything printed from BASIC , /should/ only take an LPRINT, or LIST "P:", etc.

ES> I also note that it doesn't stay in the printer port AT ALL. I'd have
ES> to tape it for it to stay, and even then I wouldn't trust it very much.

The fact that it won't stay in place on it's own, would indicate that there is a problem with connecting to the SIO port. Try pulling the SIO plug apart and 'pinching up' all the connections. The idea being to improve the contact area between the contacts in the plug, and those on your Atari.

If it *still* won't go, the you've probably got a duff unit, but at two dollars, as you say, you ain't lost a great deal.

```
ATARI 8-BIT SUPPORT FROM RICHARD GORE
-------------------------------------

My list of software for sale has now got quite long, so to save space
and bandwidth I will just give a list of what I have got along with
their prices, then if you need any further information you can simply
e-mail me at chmrig@leeds.ac.uk and I will supply the information.

My range of commercial software:-

JAWBREAKER #4 ($9) disk, tape, Rambit tape 16k
MOUSEKATTACK #4 ($9) disk, tape, Rambit tape 48k
ARENA #5 ($11) disk, 64k XL/XE
BUBBLE ZONE #5 ($11) disk, 64k XL/XE
SUPER PRINT-LAB XE #6.95 ($15) disk, 128k XL/XE
GTRACKER #6.50 ($15) disk, 64k XL/XE
CLIP TRACKER XE #6.50 ($15) disk, 128k+ XL/XE
BLACK LAMP #4.95 ($11) disk, 64k XL/XE
TUBE BADDIES #4.95 ($11) disk, 64k XL/XE

Special offer (1); buy both Jawbreaker & Mousekattack in one pack for
^^^^^^^^^^^^^^^^^ only #6.95 ($15).

Special offer (2); buy both Tube Baddies & Black Lamp on one disk for
^^^^^^^^^^^^^^^^^ only #9.50 ($20).

Ex-stock, shrink wrapped commercial software. Limited stocks. You are
advised to check stock levels before ordering:-

Disks: SUMMERGAMES #5.00 ($10)
----- SOLAR STAR #5.00 ($10) also known as Sun Star.

ONE OF EACH ONLY: DESERT FALCON (rom) #6.00 ($14)
---------------- HALLEY PATROL (disk) #2.00 ($5)
DROPZONE (disk) #5.00 ($11)
GAUNTLET DEEP'(disk) #2.00 ($5)

HARDWARE: YORKY 256k plug in memory upgrade for 800XL. Plugs into PBI
-------- port, no soldering is required. Supplied ready for use with
all RAM chips, manual and a disk of support software.
Last unit, priced at #50 ($90) plus p&p.

Prices in UK pounds (#) include p&p to UK, overseas add #2 for p&p,
payable in pounds sterling or UK cheques, IMO, Postal Orders.
Prices in US dollars ($) include shipping to USA, but payment must be
in US$ cash, sorry no cheques (checks).

For further information or to order contact RICHARD GORE at

: My machince worked great for about a hour then it stopped working. No
: lights or sounds. The transformer was fire hot.
:
: Does anyone have any idea as to what went wrong?

Smells like a bad power supply, but you will need a DMM to be sure.

: Is the power supply for the 1200XL replaceable?

Yes. As I recall its a standard 1050 type 9vAC block. I run a couple
1050's off NES power supplies, which are alos 9vAC. You might try
that, but check the current used by the 1200XL first.

: What if it is not the power supply but the switch box inside the 1200XL.

Cry :)

WOW! I just read the docs to APE by Steven Tucker, and MAN is it impressive! Macros, command-line-switches, key redefinition, configuration files, block-config. files (say you have some setup which loads up 5 specific disks in certain places and sets some other options; you can load up that setup with ONE file, not by doing the SAME sequence over and over!), MODEM support (PC becomes an 850 as well as disk drives and a printer), EIGHT (not just 4) drives allowed simultaneously, "PC mirror" (read files DIRECTLY from the PC simply using any old Atari DOS, NOT with any special commands to the PC or software on the Atari!)

EXCELLENT work Steven! Keep it up! I'm pretty set on switching from the old, now archaic SIO2PC software to this GREAT new powerful interface!

WOW! :)

2237. Atari 800 Emulators

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-22 00:00:00 UTC
From: jsisul@cstp.umkc.edu
Message-ID: <1995Aug22.092228.1@cstp.umkc.edu>
Source record: 88962
Cross-posted to: comp.sys.atari.8bit,comp.emulators.misc

Today, I downloaded A800XL, the 800XL emulator for the IBM PC.
I have to questions:

1) Has anybody tried this thing? How well does it work? (I don't own a PC to try it on; I D/L'd it to see if it came with source.)
2) Are there any other 8-bit Atari emulators out there? I'd like one that runs on a Mac, or one with source so I can try to compile it on the Mac.

I couldn't find any FAQs that answer these questions. Thanks for your help.

---

Summary of Atari 8-bit's and emulated 8-bit Atari's:

* Real Ataris: Atari 8-bit computers were produced between 1979 and 1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC can be purchased on cartridge for the 400/800/1200XL's.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.0 and 2.5x. 2.0 is limited and supports

only 800 OS. Both public domain (were always PD).
o PC Xformer 3.0x. Supports all OSes, 320K RAM,
player/missile collision detection (which MANY games
use!)
+ On Apple Macintoshes:
o Rainbow
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit
machines. Very limited. Now public domain (used to be
commercial).

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard,
non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2,
160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4
graphics are also supported. 40 x 24 x 256-character (128 normal,
128 inverse, character set indirection available) text mode is
standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character
allowed, the other 128 characters have 4th changed into a color 5)
and 40 x 12 x 128-multi-colored-character screen modes are
available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16
hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned)
screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the
Display List (a program which is executed by the ANTIC graphics
chip every screen refresh (60 times per second on real NTSC
Ataris).
* Fine scrolling (both vertical and horizontal) can be enabled on
any line on the screen.
* All other screen attributes (color, player/missile horizontal
position, screen width, player/missile/playfield priority, etc.)
can be ajusted at any point down the screen via a "Display List
Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and
four 2-bit wide, 128 or 256 byte high single color missiles are
available. A mode to combine the 4 missiles into a 5th 8-bit wide
player is also available, as is a mode to XOR colors or blacken
out colors when players overlap (good for making three colors out
of two players!) Players and missiles have adjustable priority and
collision detection (which is not supported by the PC Xformer 2.0
and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,

8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
* A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten, well, fed up with the XF2-based questions which did not pertain to them, or to the really dumb questions which were in fact understandable to new or rusty Atari 8-bit users, but had just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits [grin]).

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

Since revision 0.7 of this file, Rainbow, an Atari 8-bit emulator for Macintoshes, and "6502", an Atari 8-bit emulator for Unix, have been released, and a 4.0 version of PC Xformer has been announced (and will require Windows 95).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.
2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.
3. How do I turn off BASIC?

To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).
4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!

See "Why doesn't this program load?", above.
5. How do I exit XF and return to DOS?

Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).
7. How do I use MSDOS files with XFormer?

Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image). Example: XFORMER MYDOS45.ATR filename.ext

When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.

Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).
9. What's SIO2PC?

Refer to the XFormer and SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and
Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most
relevant to the less-knowledged/experienced Atari 8-bit users).
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents
the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in
MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to
"dir i:*.*")
+ [A] Disk directory (like "dir " and optional output
destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one
place or disk to another, just "[source]" copies from one
place on one disk in a drive to the same place on another
disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted
first) (add ">*.*" or ":*.*" after a subdirectory name to
delete the files within it. A subdirectory name alone will
delete the subdirectory (if it is empty and unlocked)). (Acts
like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but
be careful). (like "ren [old] [new]" in MSDOS - with MyDOS,
use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending
(like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which
boots with the current version of MyDOS you are using and
also has the menu file "DUP.SYS" on it as well). (This is
like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a
quick-format of an already-formatted disk (ie, just a very
fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot
sector, when using XFormer, it's much quicker to just copy
one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it
binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like
"[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ",
etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is
"E477", reset is "E474" (these are the hex values of the
addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from
BASIC, for example) it will write what is in memory to a file
"MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost
forever. When you exit DUP.SYS with the "B: Run Cartridge"
command, MEM.SAV is reloaded and the environment should be as
it was when you left. It's probably quicker to simply "SAVE"

your programs (if in a language) which aren't nearly as big as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly for advanced users or special setups. See the MyDOS docs for details.
+ [P] Set density. Forces a drive to be recognized at a certain density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS) This makes "D:" now the same as a subdirectory or other drive. ie, "D2:" will make all calls to "D:" act as though they are to "D2:" instead. Some programs when prompting for filenames do not add "D:" to the beginning if one is not present, they add "D1:". If you don't trust a program to look to "D:" instead of "D1:" and you want it to look to some place OTHER than "D1:" (ie, where "D:" is pointing which could be a VERY long path list), just add "D:" to the beginning. ALSO, some programs don't even ADD "D:"'s if they aren't in the filenames you give and may give errors (138, for example: device not present, ie, if you said "TESTFILE.DAT" it may think you want "T:" instead of "D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify is on, writes will be slower but 100% reliable. With it off, writes will be much faster but possibly not as reliable (on bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk,

you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the

"root", and all of the "Folders" within it have more windows
in them which also have file and folder icons.

Here's a comparison to using subdirectories on different
DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other
DOSes are not necessarily using drive 1, and MyDOS and
SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the
'current' or 'default' directory to a different place (a
different drive or a subdirectory). "D:" can stand for "D1:"
(like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ
THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files,
multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard
and output to the screen is normally handled. If you
wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using

"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line
into the current program.
* Entering a line number alone will remove that line from the
current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command
followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional

destination device ("D:file.lst", "P:"rinter) and an option start
and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced which
will be based on examples provided in the Atari BASIC Reference
Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self
Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go
to the Self Test when the Atari Rainbow appears).
* For XFormer users, remember, [SHIFT]+[F10] reboots and toggles
BASIC.

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are
special character arrays. See the BASIC usage/etc. files mentioned in
the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) -
now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen
modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x
24 x 2 sized text covering the bottom of the screen. Add "16" to the
mode number to remove this window (but do not make any PRINTs or PUTs
to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text

* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)
* DRAWTO x,y - draw a line from cursor location (set with "POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command colors:
* COLOR 0 will draw using the background color, set with SETCOLOR 4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd into memory locations 704, 705, 706 and 707 (the player/missle graphics color locations). Examples of this will be presented in the BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)
* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor") allows the following characters for editing:

Key:	AtASCII #:	Use:
Atari	none	Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle]	none	Turn inverse on/off (Atari XL/XE kybds)
CAPS	none	Turns caps-mode to lowercase (400/800 OS)
CAPS	none	Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS	none	Turns caps-mode to uppercase (all OSes)

Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^

Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters!
[grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.

* When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into

normal mode, set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.

* To turn this mode off, press a key, or, if within a program, use
the command "POKE 77,0" at least once every few minutes (IF the
screen is active, otherwise turning it off would be kinda
useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or
having location "77" set to "0", or set location "77" to "128"
with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):

* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary
mode 'c'. Channel 'a' must be free or else a 'Channel already
open' (129) error will occur. To explain the different "modes",
here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"
Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'
* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'

(character 155)) from channel 'a' and stores the numeric value of
it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed types are
of course allowed).
* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks.
Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive! [cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and not "ATR"? To keep people from getting confused with the

ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR"
which works on PC's (a PC executable version comes in the archive)
and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

* PC Xformer 2.0 and 2.5 can be downloaded via FTP from:

2241. Trade Jag setup for good 8bit setup

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-22 00:00:00 UTC
From: James Kimball <jkimball@calweb.com>
Message-ID: <41d0q7$ka5@calweb.calweb.com>
Source record: 88966

I have a Jaguar with the most popular games (avp, iron soldier, blah blah blah... 7 total I think), the S cable, extra controller, all games have there joypad covers if they were made with them.

I am looking for a 800xl or 1200xl <-- prefer. And a bunch games and a disk drive. and any other goodies.

anyone care to trade? I'd also settle for a 5200 or 7800 game system instead.

please send replies to my email

jkimball@calweb.com

Thank you very much,

James

Odd - I just reposted my FAQ the other day.

Anyway, A800XL is pretty much garbage. :)
For PC's, there's PC Xformer 2.52 (free) and 3.0a (commercial).
For Mac's, there's Rainbow (shareware).

Rainbow is by Chris Lam: lamcw@helios.aston.ac.uk.

>I couldn't find any FAQs that answer these questions. Thanks for your help.

Oh, for God's sake, don't act so f***ing helpless. By "I couldn't find any
FAQs," do you mean something sane like, "I've been reading this group
for a month (which is a typical amount of delay between posting FAQs)
and haven't seen a FAQ posted," or, "I checked the FAQ archives at
rtfm.mit.edu under comp.emulators.* and couldn't find a FAQ there;"
or do you mean something demonstrating such a lack of intellegence
that you may have to concentrate just to avoid drooling on yourself
such as, "I just added this newsgroup to my .newsrc file and the
FAQ didn't fall into my lap, so I decided there must not be one."

There was a comp.emulators.misc FAQ posted on the 11th, an Atari
8-bit FAQ posted on the 19th (THREE DAYS AGO!!!!) and an Apple II
emulator FAQ posted on the 2nd. If you wait at least a month, each
of these three documents will be again.

Both the comp.emulators.misc FAQ and the Apple II FAQ are archived at
rtfm.mit.edu.

And, before you ask, there's also a FAQ for Commodore 8-bit machines.

Please, do some reading. You're reinforcing negative stereotypes about
the intelligence of Macintosh users.

2248. APE 1.04 is here!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-22 00:00:00 UTC
From: classics@nacs.net
Message-ID: <41db15$3vg@bab5.nacs.net>
Source record: 88973

After much much more work than I ever thought I would put into this
project, APE (The Atari Peripheral Emulator) version 1.04 is ready
for public release!

What is APE? Here is some information from the users manual:

The Atari Perihperal Emulator (APE) is a advanced serial application that
emulates an entire subsystem of atari 8 bit peripherals using your
existing or purchased SIO2PC compatible serial conversion device.

What SIO hardware does APE emulate?

The following SIO hardware and command systems are supported:

* Full cooperation with REAL sio devices, such as disk drives.

* SpartaDOS ULTRASPEED I/O in any drive/density
* Upto 8 Diskette Drives
* Single, Double and 1050 Enhanced Density for any drive
* Disk images of upto 16 megabytes in size!
* PC MIRROR drive gives access to files on your PC hard drive with
any Atari Dos!
* Emulation of the Atari 850 interface, allowing you to use
your PC modem and printer from any atari application that
can use the 850 interface. 100% 850 stage 1 compliant.
* Hardware flow control for the PC modem using the R: device.
* Basic SIO Commands Supported
- Read Sector
- Write Sector
- Put Sector
- Disk Drive Status
- Controller Format Diskette
- Controller Format Enhanced Density Diskette
- Read Percom Extended drive configuration block
- Write Percom Extended drive configuration block
- Force Ultraspeed
- Ultraspeed I/O Sector Skew Format Diskette
- Print to 850 interface

* XF551 High Speed Read Sector
* XF551 High Speed Put Sector
* XF551 High Speed Write Sector
* Happy Warp Speed Read Sector
* Happy Warp Speed Put Sector
* Happy Warp Speed Write Sector
* Happy 'Are You Happy?' Command

* Happy Read Status Command
* Happy Format Diskette
* Happy Init Controller
* Happy Reset Drive
* Happy Set Unhappy Mode
* Happy Set Fast Write
* Happy Force Protect
* Happy Force Write

What hardware is required to use APE?

APE talks to the SIO bus of your Atari 8 bit home computer using an SIO2PC compatible serial cable. This serial device provides the hardware required to convert the voltage levels present on the Atari SIO bus to levels compatible with the PC serial port.

This device hooks directly to the SIO port of your atari computer, and to the serial port of your PC compatible computer. No interface or other additional hardware is required!

What advanced feaures set APE apart?

* APE can utilize your PC modem as an ATARI modem, no expensive 850 interface or other hardware is required. Registered users have full serial access at upto 19.2k bps.

* APE is currently ready to handle 38.4k bps connections for use with high speed modems. This will premere in registerd version 1.05.

* Future revisions of APE will allow serial access at 57.6k bps. This is currently being tested and does work.

* Ape can emulate Happy and XF551 warp speed (2x) I/O rates, allowing you to use dos systems such as MyDOS and Atari DOS at warp rates.

* Ape 1.05 will contain a feature never before seen on the Atari computer: SIO DISK ACCESS AT * 3x * standard SIO rates using an XL/XE software OS patch. Thats 1.5x faster than Happy, XF551 and USDOUBLER Ultraspeed!

* Loading and saving of block configurations. Load upto 8 disks instantly at the push of a button.

* PC MIRROR drive allows direct access to all the files on your PC hard drive from MyDOS, Atari DOS, etc. Copy your files with ease and let APE do the work!

* User definable keyboard macros allow automation of any APE function.

* Write protection of your ATR images.

* And much more!

How can I get APE?

APE has been uploaded to the Merit Atari Archive at
atari.archive.umich.edu, and will appear in the 8bit/Ape
directory.

Until then, you can contact me directly for a distribution package.

I will ne happy to e-mail the distribution to you uuencoded, about
90k. If you do not have e-mail access send a SASE w/ a 1.44M
diskette to the address below and I will return it by postal mail.

Include $2 if you cannot provide a diskette.

You may contact me the following ways:

Internet E-mail: classics@nacs.net [this is the preferred addr]
dh395@cleveland.freenet.edu [emergency backup]

Telephone: 216-237-5308. Anytime you can catch me at home
is pretty much ok. Just try and call before 11pm EST.

Snail Express: Steven J Tucker
9897 York Road
North Royalton, Ohio 44133 USA

Ordering the registered version of APE:

Ape is distributed as SHAREWARE, on the 'try it before you buy it'
system. See REGISTER.DOC in the shareware distribution for
information on obtaining the enhanced version of APE.

Updates to the program since public beta version 8 was released:

* Bugfix for 1050 formatting and status routines
* Happy high speed reads now supported
* New syncro code added, great improvment!
* Better swapping method, you no longer have to press the
existing image first, either is fine.
* Happy high speed write support added
* Some extended Happy commands now supported
* Write protection of images now effective
* Command line options added
* User now asked to mount image after creation
* 850 Interface serial emulation now working at 9600 baud
* Scrapped 850 interface code and starting rewriting
some public domain R: code.
* Automatic switching between command and concurrent i/o mode
now working
* PC MIRROR directories are now built on the fly
* Support for 43/50 line screens installed
* 850 Interface R: emulation now working at 19.2k bps
* Added General/Serial configuation screen
* Added command filters
* Added slow machine display options
* Added user definable framing value
* New streamlined core serial i/o routines. Much faster now.

* Now recognizes many more extended happy commands
* Added hardware flow control for PC modem, now works
automatically.
* Added user definable flow control threshold
* Added the ability to load and save block configurations
* Added enhanced command line help and registered CL features
* Added Path/Macro configuration screen
* Added support for default paths and file extensions
* Added support for quick macros, and editing code
* New consolidated configuration menu, 'I' function for printer
configuration now in this menu.
* Improved and incorporated my multi-type text browser into
APE. Can also be called from the command line. (reg)
* Improved file selector, now has title and user can enter
own path/filespec using the TAB key.

Public Thanks:

Where to begin! When I started APE it was nothing but a little
program that could read single density sectors out of ATR images, and it
didnt even do that well :) Without the help, encouragement and suggestions
of the following people APE would not be here.

William Kendrick, Itay Chamiel, Kevin Atkinson, Tamas Bene, Rick Cortese and
everyone else who's e-mail connot be found at the moment :) Also thanks
to everyone in the newsgroup who helped out!

Steven J Tucker

Not RS485, that's a two wire serial infterface simular to
Token Ring. You can daisy chain RS232 but ONLY with the
proper UART that supports it and has both ports installed (an IN
and a OUT). At work we have a few test fixtures that we chain
up to 16 interfaces together and talk to each one individually. The
RS232 loads the Flash RAM or EEPROMs, plus allow us to make
changes on the fly. Also, you need to proper driver code.

Sorry about those extra posts, my Mail Serve was screwing up.
Anyway, my Atari 600XL schematics show all the componets but I've never
checked to see if they are all installed. Agreed, the Super Video 2.1
upgade would be much better.

2254. PC-xformer questions

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-22 00:00:00 UTC
From: nltd@grove.iup.edu
Message-ID: <1995Aug22.175550.478@grove.iup.edu>
Source record: 88979

I'm new with this group so please don't flame me too much for this question but where can I get a copy of pc-xformer 3.0 (the commercial version)? Also could someone tell me the cost of such a wonderful device? Finally, will I be able to use native ATARI 8-bit disks (of which I have about 200) that autoload or do I have to cvonvert them somehow to read them in. Any help you could give me would be greatly appreciated. Thanks.

Cliff Friedel
NLTD@grove.iup.edu

From: cudabert@aol.com
Message-ID: <41dpbc$62e@newsbf02.news.aol.com>
Source record: 88980

PC XFormer is available from:
Branch Always Software
14150 N.E. 20th St., Suite 302
Bellevue, WA 98007

phone: 206-236-0540
fax: 206-236-0257
email: brasoft@msn.com, brasoft@aol.com

PRICE: $29.95

Yes, you CAN use your native Atari disks, but you'll need to build an SIO2PC cable first. The instructions are included with the PCXformer package (I think! I got it from somewhere). Actually, you'll probably be better off downloading the disk images from the Atari archives at umich.edu

2256. SpartaDos X 4.22 update

Newsgroup: comp.sys.atari.8bit

hoo-rah! sounds very cool. I'm thrilled to see this sort of
development for the atari...

A few questions about your product:

Is source available?

Is it possible to add in new devices to be emulated, if someone were to
want to (without source editing & recompiling)?

And the main thing: Is it possible to get this to run under NetBSD (UNIX)?
I have no DOS systems running in the house right now; I would prefer not
to have such creatures around, on moral grounds... :)
This is the main reason I ask about source. What language did you
write it in?

I am very certainly going to have to have a look at this system; it

Message-ID: <144133@cup.portal.com>
Source record: 88983

>I believe I wrote that the 6502 has no way of accomplishing indirect
>addressing except via page zero. As we all know, page zero is a cramped
>place with a finite number of addresses. This type of resource limitation
>makes traditional use of page zero impossible in the context of the
>flexible system I have designed.

Thanks for clearing that up. I missed the context of the "except page 0"
part. Although personally, I don't find page 0 (nor $100 bytes of stack)
to be that cramped, and thought programs could have a ZP allocation scheme
not unlike normal memory allocation. Especially since a new OS could be
coded to use much less than the $80 bytes the stock version uses.

Before that comment goes too far, let me say that I applaud any of your
efforts to provide a better solution, which it sounds like you have.

>True-position-independent code vs. relocatable object file format...

With all the terms like "fooling" and such, I'm not sure whether this
point was clear. It sounds like you are creating a way of making
position-independant 6502 code, and I don't know whether this is going to
require any special programming practices. As Brent already pointed out,
a relocatable object file format lets you use regular absolute addressing,
with the addresses patched by the OS to match the file's load location.

>...Amiga...

> 2) screen flicker, screen flicker, screen flicker....
> 3) a CLI AND DOS? I guess they couldn't decide. Ever notice how you
> HAVE to go to AmigaDOS to do anything useful?

It doesn't sound like you have seen current versions. I had these same
opinions at first, but _NONE_ of these problems exist on current versions of
the OS, and/or current machines. Crashes are very much under control as
well. A long time ago, I made the statement that the Amiga was a wonderful
chipset, but imprisoned and crippled by a horrible OS. Now, the OS is the
ONLY reason I continue use the machine, and why I find all other machines
inferior. It really has changed that much.

>ACTIVE 16K bank to start out with? It can't, and therefore that method
>will not work.

You only need a minimum skeleton handler resident in low memory, because
once it gets control, it can call subroutines in high/banked memory. ALL
of the code doesn't need to be in low RAM -- just a part that needs to
intercept control at any time.

I used to own one of these, until I got a P:R:C. No special driver is
required. Make sure no other printers are connected that would handshake
when you send something to "P:". I seem to remember some conflicts between
the cassette buffer and printer under Atari BASIC (?), so clearing one
may help the other work (I'm trying to remember from 8 years ago). Also
try printing/copying directly from DOS (like in DOS 2.5, use "C" to copy
a text file directly to the printer).

2264. Re: New 8bit OS

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-23 00:00:00 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5rEibhb.lmcclure@delphi.com>
Source record: 88856

In a message dated 8-18-95, Michael Ellis said (about the Amiga):

"possibly the ugliest, least intuitive GUI in the world"

Sounds as if you have not really seen an Amiga since the days of the garish (and IMHO, embarrassing) orange/blue/white "crayola/cartoon" default color scheme of WB1.3 (although even if you changed the colors, it still looked rather goofy, IMO).

That was dropped with WB2.04, when the default setup became shades of grey with beveled boxes around muted icons and a more "3D" appearance overall. The current version is 3.1

"screen flicker, screen flicker, screen flicker...."

Of course, if you had seen an Amiga 3000 running a 640x400 screen with no flicker on a VGA monitor, you would have seen WB2.04. The current AGA machines also have non-flickering modes. Of course, flicker was always a choice...a shortcut to higher vertical resolution...the same way that FlickerTerm on the Atari 8-bit is a shortcut to 80 columns, and APAC, etc. are shortcuts to greater color resolution.

"CLI AND DOS? I guess they couldn't decide. Ever notice how
you HAVE to go to AmigaDOS to do anything useful?"

This again makes it appear you have not had any decent exposure to an Amiga with anything greater than the ancient Workbench 1.3. Since WB2.04, Workbench has been capable of just about anything you might care to do in AmigaDOS. Of course, being primarily an Atari STe user, where GUI is the rule, I will admit CLI sometimes has it's advantages. After all, it is difficult to write a GUI script (.bat file to PC-persons)! <grin>

I am not out to convince you to rush out try a new Amiga (or even an old Amiga with a new OS), but rather to point out that it appears that you are basing your dislike on old data. It would be rather like the owner of another computer criticizing the Atari 8-bit for "not being able to expand beyond 64K of memory, not being able to display 80 columns, and not having access to any storage media larger than a floppy drives that store 90K each" (none of which is accurate any longer, of course).

This should be possible. You could refer to both the 800 and the XL schematics from Sams, and figure out some compromise. You'll need either a transistor or op amp to provide the drive for an 8 ohm speaker. I have both schematics at home... I'll try to remember to take a look at them.

You don't need DISK IMAGES to use EITHER Rainbow or XFormer.. you can simply access raw files from either of them.

There are of course bootable disk images for Ataris out there (how else would bootable game disks and DOSes and the like be transferred?). These are DCM images. Either use DCM2ATR (PC or Unix) or DCM2DISK (PC) or DiskCommunicator 3.2 (Atari).

Read my FAQ? And if there's something you can't find answered in there, all you have to do is ask and it shall be added! :)

Yes, your 800XL PS and drive will work. Yes it will run MOST 400\800
software. Compatability is pretty good but deitnitly not 100%, especially
with the 1200 OS, generally held in the lowest regard of all the 8-bit
OS's. I have a few 1200's converted them all to 800XL OS's, piece of cake.
Contact me by email if you want details. Have fun, I love my 1200's!

Chris Lam (lamcw@aston.ac.uk) wrote:

: The uses of a SIO2MAC are clearly powerful. However, the skill needed
: to construct a cable is best left to electronic hobbyists. I've had
: comments about how people were too timid to even connect up their
: 850 module to the Mac and here we're just talking about wires!!

: However, if someone starts a small business selling these SIO2MAC
: cables, that would be interesting ;))

I remember seeing a post about somebody making a whole batch of SIO2PC
cables using printed circuit boards and 232-to-TTL convertor chips.
Since the Mac's serial port is compatible with the PC's, it's possible
to just use that SIO2PC cable. My design isn't really an
ideal way to do it, but just a cheap way to connect the Mac to the
Atari.

Anyway, I don't think there's that much demand for a SIO2Mac cable.
It does take a good bit of skill to make your own cable, and there
doesn't seem to be much overlap between Atari 8bit users and Macintosh
users. As for me making these cables and selling them, I just don't
have the time to put it together, test it, and sell them because of
classes.

For hobbyists though, it is a fun project to see a PowerMac and an old
Atari 8bit wired together.

Rick_Michael_Cortese@cup.portal.com wrote:
: Lucious, just a suggestion or two. The 100k resistor going into the
: NPN transistor is a little bit on the conservitive side. Figure the
: NPN transistors will have anything from 20 to 200 for the amplification
: so worst case part it will only transfer something like (5V/100k)(20) amps
: or about 1 mamp. AFAIK, the lines in a lot of Atari stuff are pulled up so
: it may not be enough horse power to get the job done. Figure RS232 specs
: imply it's supposed to be able to drive a 3k load & maybe use a 3k-4k
: resistor to the base of the transistor.

Oops -- I made a typo there. The 100k resistor is supposed to be a 10K
resistor. A 3K resistor would also work.

: Also, a safer way to do what
: you have listed as a germanium diode would be to use either a zener or
: a zener in parallel with a germanium diode. With the current design, if
: the Mac put out a 12V signal, the data in port of the Atari would see
: +12V through the resistor. If you had a 5.1V zener, it would perform the
: same forward switching as the germanium diode <albiet not quite as well>
: and would limit the voltage on the Atari to the +5.1V, well within the

The Mac the I have only sends out about +/- 4 volts, so I thought it
would be OK to use a germanium diode. I don't have reason to believe
that any Mac puts out more than about 4.5 volts, but it's probably a
good safety measure.

: specs for TTL. Of course if you want to change the NPN to a Darlington
: transistor, that changes everything<grin>.

Source record: 88994

Anybody remember the real cool little program called "AppleKiller", where there's an Atari logo and an Apple logo. The Apple shoots a bullet at Atari which bounces off. It then retaliates by shooting a bullet at the Apple which slices it in half. Then the words "ATARI COMPUTERS" and "APPLE COMPUTERS" are printing on top of each other. The ATARI words crush the APPLE words into "APPLESAUCE" It's quite amusing! The irony is that I now work with Macs and still dream about the days of my 800!!!!

Larry

2278. SIO2PC Building Troubles

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-23 00:00:00 UTC
From: mbrown@fn1.freenet.edmonton.ab.ca
Message-ID: <41e65q$qve@news.sas.ab.ca>
Source record: 88995

Can anyone send me the scematics for the SIO2PC? I've downloaded the files in one of the FTPs which contains an ASCII representation of the file, and mentions that it comes with a GEM file of the schematic, but alas, its no where to be found. I've got text files explaining the two chip and single chip versions (I'd prefer to build the single chip version). But not be electrically inclined, I can't quite get everything straight in my mind, and on my circuit board. Soldering doesn't bother me, and as long as things are explained without too much electrical lingo, I feel confident enough to build the interface. Thanks. If someone could mail me the GEM file, or a PCX, GIF, TIFF, PS version of the schematic, that would be much appreaciated. Thanks again.

Do the Super Video upgrade. It was published in Atari Classics in I think
December '93. It is well worth ordering a back issue. It will save you
the hassle of figuring out what components to replace since it gives
step-by-step instructions on how to install an upgraded video amplifier in
a 600XL from scratch. The results are much better than stock XL video.
You won't want to go back for anything.

First of all, I'm delighted to find this newsgroup. I can vividly remember the days of CLOADing Galactic �hase, fingers crossed, off the frigging cassette drive. Second, I have two Happy 810 drives (one a "real" Happy, one a clone from that loser Bob Gardner). Is it possible to utilize the Happy drives to create SIO2PC images of protected disks? It shouldn't be too difficult to simulate the error sectors and weird timing schemes that software houses once used. (In reality the only protected game I care about is M.U.L.E. - I loved it and even the original disk didn't always boot due to the heavy protection EA put on it.)

I keep hearing that the "lack of memory" is the big problem with implementing Zip/UnZip on the Atari. Although I've never looked at the Zip/UnZip algorithms myself, I assume that you simply need to maintain a large "code table" that grows as the Zip/UnZip operation proceeds. Wouldn't it be possible to maintain said table ON DISK instead? We DO have note-and-point "random access" to disk files, after all. Just instead of referring to code-table-array elements a la

array[element]

you would have to code a little more complicated expression like

paged_out_array(element)

You might have to add channel arguments or something, but maybe not; you could EASILY have a "transparent" disk-based-array-manager package that did all that for you. :-)

And yes, you'd suffer a performance hit with a disk-based "virtual memory" scheme like this, but hey, if it lets you get a job done that you otherwise COULDN'T DO AT ALL, -I- for one am certainly not going to complain! :-) Now HOW BIG a "scratch file" would you need? I only have floppies, here, no HD on the Atari. (Okay, so MY version of the disk-based-array-manager would have the ability to "split" the array over as many floppies as I could spare aside from the one(s) containing the actual "source" and "destination" files... :-)) Hmm, combine this with an SIO2PC-like "virtual disk," and you could do a LOT of things on the Atari! :-)

>I have written a small untar utility in Action! at about the same time I
>was working on the unzipper. If anyone is interrested, I could put it in
>my ftp directory...

I'd be interested. Please tell me/us where to pick it up. Thanks!

>you could give me would be greatly appreciated. Thanks.
>
>Cliff Friedel
>NLTD@grove.iup.edu

The address has already been posted, so I won't redo that. The XFormer (currently v3.2) doesn't read Atari disks directly. I simply DiskCommed the disks onto my 800xl's HD and then used BobTerm to Ymodem the whole lot enmass to my PC.

There are some problems, though, with games which want you to have multi disks, like some of the SSI games. Also, copy protection can be a problem as well.

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for them,
but I will not guarantee that I find them. Shipping will vary
depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari 2600 jr, no cables not working

-Atari 5200, 4 port, w/ manual, switchbox and joysticks $15.00 min

-Atari 800XL w/ power supply $8.00 min

-Atari Keyboard Controller

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction is from Sunday, August 13th until Sunday, 20th
at midnight mountain time.

2. Current high bids will be posted every other day on this newsgroup and bidders will most likely be notified when they are outbid for an item.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be ATARI BID .

5. Minimum bids will be $1 and bidding increments will be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50 for each additional cartridge. Shipping and handling for systems will range between $6 and $10.00 depending on weight. Larger systems may be more. All cartridges and systems will be shipped through the US Postal System anywhere in the Continental US. Other areas will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted. Payment MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased from this auction. Cartridges have been tested and do work, unless otherwise specified. Most systems have been tested and do work. The systems which may not work are the ones without cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent to follow these rules as stated.

2298. COLECO,INTV,ODYSSEY2,TI99/4A AUCTION

COLECO,INTV,ODYSSEY2,TI99/4A AUCTION

WELCOME TO THE VARIETY AUCTION

I am posting this auction here becuse I believe that some people who read
this
newsgroup are interested. Here is the order of the items in this
auction.
Please
take the time to look through this auction for things
you might want and then send me a bid on those items.

Colecovision
Intellivision
Odyssey 2
Commodore
Texas Instruments
Misc Systems

This Auction will end at Midnight Mountain Time on
Sunday September 3, 1995

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <144182@cup.portal.com>
Source record: 88872

This is another one of those "While I was resting..." kind of things. Since the code to using the SDX PrintF routines from assembly got posted & since the Action! manual tells you your programs can run without the cartridge but doesn't tell you HOW to do it. Well the manual says you just can't call any of the routines in the CART, but I remember thinking at the time, "Well then, how the hell can you write a program?" Anyway:

```
DEFINE BPUT="$B"

PROC CIOV=$E456(BYTE A, X)
PROC MAIN()
;
;I'll just use channel 0 for
;command, buffer address, &
;buffer lenght since I know
;it's open. I could have used
;put text record <9> for the
;command, but you still have
;to make sure the buffer length
;is greater then the string you
;want to print & add the EOL to
;your string so...
;
BYTE ICCOM=$343
CARD ICBA=$344, ICBL=$348
BYTE ARRAY Message="Hello World"
ICCOM=BPUT
ICBA=Message+1
ICBL=Message(0)
CIOV(0,0)
```

This whole mess compiles to 81 byte file including the header & init info. Of course to run under SDX, you have to have to start with an RTS, but you'd have to do that with any binary file that uses the INIT vectors. OK, the two arguments people talk about, asm vs Action!, are speed and size of code are superior with a Macro Assembler, these people are either not familiar with how Action! works, don't know how to use the Macro functions of their MAC/65 cart, or bypass the macro functions to write tighter code. In simplest terms, let's say you have a MoveBlock macro defined that uses maybe 40 odd bytes, now let's say you have three blocks of data you want to move into postition for say P/M Graphics, Playfield, & character set, something like:

```
MoveBlock $4000, chardata, 1024
```

```
MoveBlock $8000, PMdata, 800
MoveBlock $9000, Playfield, 480
```
For each of those MoveBlocks, the assembler Expands the entire Macro! In other words, you've got three copies of the MoveBlock routine in memory at the same time taking up 120+ bytes! Of course you could write it tighter in pure assembler, but don't add the word MACRO in the same sentence! Just ain't so. A matter of semantics. It's possible to write macros that use subroutines, but in practice, I've never seen anybody that does it, probably because except for a few simple functions you lose speed when you do it that way. Even if you do use subroutines, the calling convention from Action! is such that you can not do it significantly faster using assembler. For example, let's say I'm writing a program that does a lot of I/O to the screen so I want the above to be generic, it then becomes:

```
;generic part
DEFINE BPUT="$B"
PROC CIOV=$E456(BYTE A, X)
PROC Aprint(BYTE POINTER Bptr)
BYTE ICCOM=$343
CARD ICBA=$344, ICBL=$348
ICCOM=BPUT
ICBA=Bptr+1
ICBL=Bptr^;ICBL=Bptr(0) works also
CIOV(0,0)
RETURN
;program
PROC Main()
Aprint("Hello World!")
Aprint(" How are you?")
```

The Aprint() routine just loads the AX regs with the address of the strings & JSRs to the print routine, tell me how you're going to pick the address of a string off faster in assembly? The print routine which is only about 70 bytes takes care of the rest. In other words, if you know what you're doing in Action! & aren't to sharp with your macro assembler, you aren't going to write tighter code or noticibly faster code either! As far as speed goes, I'm willing to bet dollars to donuts that the same routine written to call CIOV in Macro OR pure assembler would not be more then 10% faster then the Action! code. Why? Because all the time is spent in the CIOV routines, not the user code.

I read this after just downloading RAINBOW...

>;Voila! I was totally suprised when I saw the old Atari right there
>;in a window. I expected it would take hours of hacking the ROM
>;file, but it was effortless! What an impressive program.

Now I REALLY want to get this thing to work, but alas my trusty old 800xl
is DOA and sitting in a basement a state away. Is getting my 800xl up
and running and hooked up to a P:R: Connect the _only_ way I can get a
copy of the Atari OS ROMs? Any help would be appreciated...

2303. SIO2PC Building Troubles

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-25 00:00:00 UTC
From: mbrown@freenet.edmonton.ab.ca
Message-ID: <41jilh$1gn@news.sas.ab.ca>
Source record: 88875

Its me again. I've got the SIO2PC board all assembled, and it passed the 'smoke test' (there wasn't any). But I can't get it to work. Firstly, all the voltage checks according to the docs work, but for one. On pin 9 of the PC connector, the output is -9.4v instead of 9.4v

Also, the schematic shows pins 8 and 9 of the '232 chip as an 'extra' circuit. Should these two pins be connected to something? Or to each other? Otherwise, everything seems to check out ok.

On the shokky diode (sp), there is a white band around one end of the diode. Which direction should this be orientated? Thanks, and sorry to bother those that are sick of seeing stuff like this...

2304. Re: New 8bit OS

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-25 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <41jqf7$no8@nic-nac.CSU.net>
Source record: 88876

Eric - of course it'd be ran off of hard drive!

Ok, you quoted some outrageous numbers just now: $500-600 !?!?!

Let's see.. that $10 800XL
+ $70 Sweet16 CPU
+ $100 or less MIO2
+ $100 for 100MB of hard drive!
+ $50 or so probably for some RAM (256k maybe?) .. just a guess
---
$330

That's roughly 3/5th what you quoted...

Now, let's see.. a good simple GUI on the 8bit might take 128K ... that's 64K standard RAM plus another 64K above that.. Also, you said banked.. wrong. That'd be linear. ie, in this example, that'd be 128K of GUI system software right there for everyone to grab.. no screwy 64K-at-a-time baking going on at all..

Also, you said use PC Xformer as our "souped-up" 8bit.. Let me first say this is by NO means a new idea.. heck even I thought of it at one point.. BUT - NONE of the emulators compare in timing, compatibility, or ease-of-use (remapping the keyboards they way both Xformer and Rainbow did it are akward when so much software assumes you have a standard keyboard when it's telling you what to press - HyperIt!, for example, cannot access it's Un-CONTROLled arrow keys with Rainbow since the user would be pressing keys on the Mac keyboard which are at the same place as where they WOULD be on an Atari... great if you're used to the Atari keyboard layout back and front... but my brother is not... he must live without on his big ol' PowerMac)..

Whoa.. ANYWAY :) .. my point was, not only are none of these emulators CLOSE to perfect, but I'd be AMAZED to see them become 65816 CPU compatible any time soon...

FINALLY - you mentioned soldering irons... hmm.. let's see.. Sweet16.. Unplug 6502, plug in Sweet16... 1 minute or less installation time.

RAM upgrades - banked upgrades are pains.. but they work funny.. they're banked... they're more a hack than an upgrade ;) ... Sweet16 doesn't USE banked memory (it CAN, just like a regular 6502-using 8bit, but it can't use it as linear RAM because it's not wired up for it!). The MIO2 or Mars8 and/or other more specialized upgrades will add "big linear RAM" on 65816 units and I'm betting on it being as easy to install as the Sweet16 itself. Ah.. almost forgot: Yorky256K ... :) Richard, does that need any soldering? ;) Didn't think so! :)

Hard drives- hmmm... BlackBox - that's plug-n-play (when it comes to soldering anything). Same with MIO, right? MIO2 should be IIIIdentical.

SO - not only is a souped-up machine easy to make - I mean, although I had some help from Ben Corr (cuz I'm a wuss and also neither of us had the right sized pin extenders for the Sweet16), BUT it's PRETTY CHEAP!

(let's see.. $35 for a 256K 800XL + $70 for a Sweet16 + a free PC as a disk drive + a free SIO2PC cable which is worth $10-15 ... that's a grand total of $120 for my system - big disk access but no hard drive.. great CPU but no extra RAM for it.. so I'm guessing $200-$250 total once HD + RAM are added)

Anyway - so Eric - even though it KINDA sounds like you're almost for these neat hacks and a good OS (or OE) to go with it, I must say it wasn't at all a very encouraging post...

... hence my blathering above....

Take care

-bill!

There was indeed a handler for the Ape Face. It generally came with the
hardware and was available at certain bbs'. Good luck trying to find one,
but if anyone in the world can help you, you are in the right place to do it!

>
>Oh, for God's sake, don't act so f***ing helpless. By "I couldn't find any
>FAQs," do you mean something sane like, "I've been reading this group
>for a month (which is a typical amount of delay between posting FAQs)
>and haven't seen a FAQ posted," or, "I checked the FAQ archives at
>rtfm.mit.edu under comp.emulators.* and couldn't find a FAQ there;"
>or do you mean something demonstrating such a lack of intellegence
>that you may have to concentrate just to avoid drooling on yourself
>such as, "I just added this newsgroup to my .newsrc file and the
>FAQ didn't fall into my lap, so I decided there must not be one."

Good grief, he just asked for some help! Why don't you save your angst
for something more worthwhile?

>Both the comp.emulators.misc FAQ and the Apple II FAQ are archived at
>rtfm.mit.edu.
>
>And, before you ask, there's also a FAQ for Commodore 8-bit machines.
>
>Please, do some reading. You're reinforcing negative stereotypes about
>the intelligence of Macintosh users.

Oh, puh-LEEZ! Spare us the holier than thou bit... (I use both, before you
jump on me about *that*) %^)

Jim, check this newsgroup for Aug. 19. Bill Kendrick posted a very useful
FAQ which has the information you're looking for. There is a shareware
program called "Rainbow" which is an Atari 800 emulator for the Mac. You
can get it via anonymous ftp to info-mac... (I'm not sure of its exact
location there but it's up).

2308. SIO2PC Building Troubles

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-25 00:00:00 UTC
From: Brad Rogers <brad@pianosa.demon.co.uk>
Message-ID: <303e3d17@pianosa.demon.co.uk>
Source record: 88880

Whilst reading the usual rubbish I find here, mbrown@freenet.edmonton.ab.ca
wrote something interesting to All about SIO2PC Building Troubles:

Hi mbrown@freenet.edmonton.ab.ca,

I know nothing about SIO2PC, so can't help you with your voltage problems.

mfe> On the shokky diode (sp), there is a white band around one end of the
mfe> diode. Which direction should this be orientated? Thanks, and sorry to

This I can help with though.

The bar is the cathode end. Diodes are depicted like this in circuit diagrams:

```
_|\_
|/
```

The cathode is the pointed end. Find out where that connects to, and solder
the diode in place accordingly. If you've got a printed circuit board with
component idents printed on it, you should find the cathode end of the diode's
position marked. Perhaps with a solid bar, a dot or a plus sign (or something
else!)

```
_
Regards, /_) 2:251/48.15 39:134/16.15
/ _)rad brad@pianosa.demon.co.uk
```

... The day was sicky yellow, the night was so untight.

2309. Golf Tour 95!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-25 00:00:00 UTC
From: CHMRIG@EAST-01.NOVELL.LEEDS.AC.UK
Message-ID: <3BEBB4358D7@east-01.novell.leeds.ac.uk>
Source record: 88881

Its a good job I have a sense of humour and can take a joke, eh Bill!

Actually Golf Tour 95 started life as Golf Tour 94, so its even later than you think. The programmer working on the game is currently involved in his Gtracker/Clip Tracker software, updating and enhancing the software to use extra XE memory and play back two or more samples simultaneously, and I think Golf Tour 9x has been put on hold for the time being. Maybe I should remove it from my advert if it offends people that much?!

I do hope to eventually release the game, but I don't have any screen shots or a demo version to upload, sorry.

2310. Re: WANTED: "Atari Connection" circa 1983

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-25 00:00:00 UTC
From: ziggy29@rahul.net
Message-ID: <41ktnh$gmo@bug.rahul.net>
Source record: 88882

A. Karl Heller (heller@cdnow.com) wrote:
: Tim Irvin (ziggy29@rahul.net) wrote:
: : etxansk@garbo.ericsson.se wrote:

: : : Does anybody know if any of the Atari Connection, Atari Age etc
: : : magazines are seen as collector's items today, which would make
: : : the price higher?

: : In general, no. These old mags seem to be selling for around
: : $1 each in most cases. There may be exceptions, but for most of
: : the magazines, it seems to be roughly the going rate.

: Thats not exactly true. You can get a good market value on the
: rec.games.video.classic group.. if the mag has game info etc...

I suppose that's true; it's also why I said "in general" rather than
treating it as an absolute.

Gamers seem more attached to their classic systems then any other
form of computer user. How many current Excel or Lotus 1-2-3 users
are longing to use Visicalc? How many Word, WordPerfect or Ami Pro
users are incredibly nostalgic about Atariwriter or WordStar? Yet
gamers--even those who appreciate the glamour, glitz and presentation
of today's massive games--still love to play those old games they
first experienced over ten years ago. To some degree, the same can
be said for software developers. If you've fallen in love with
programming on one platform, you'll probably always want to work
with that system, even after it's considered obsolete by the masses.

The point is this: Mass-produced, general-interest magazines
focussing on a particular platform are rarely prized highly by
people using the system for a specific use (i.e. gaming) which
usually gets only one or two columns, often about very
forgettable games.

Sure, the one which writes about a M.U.L.E. or an Ultima III
will be treasured by classic Atari gamers, but the one which
is mainly comprised of business software reviews and other
issues which few current Atarians consider exciting and romantic
(in my experience) is not likely to fetch much more than a buck
or two. (Not to say that the occasional gem with a particularly
prized article can't get $10, but I still think that *in
general* it's the exception.)

On that note, I picked up a few back issues of Computer Gaming
World, mostly from 1982 to 1986, a few weeks ago. There is a lot of
cool stuff in there! It reminds me of some of the titles I hope to

find someday...

Source record: 88883

Hello,

I saw (on some www page about hardware) that people out of Czech rep. know datarec. XC12 only in "standart" mode. I have a plan of board and programm for using it in "Turbo" mode: 2200-6500 Bd. Everyone uses it here - it's very practical. The files can have names, of course. (In standart no)

People in newsgroup think the SpartaDos is the best and anyone doesn't know TTDOS. This shortcut means "Turbo Tape and Disk Operating System". This DOS works with datarec. (with Turbo of course), diskdrive and ramdrive. It creates a small ramdrive "under ROM" on 800XL/XE. Everyone who knows it say it's the best DOS for ATARI.

I have a original "Atari klub Praha" plotter and I have a plan also. I have a bag of soft for it of course: hardcopy of screen, editor etc. It can move pen relative even absloute, write letters, change size, declination and direction of writing and some more functions.

"Turbo Monitor 2204" - programm for monitoring memory, it can disassemble a code, some functions with blocks of memory ("readress" also - it means move and change adresses after LDA,STA,JMP etc.), read&write to datarec. in standart and TURBO mode, diskdrive, ramdrive. I think the best what I saw. I wrote programms in machine code with this monitor... The last point about it: it's placed "under ROM" - it can be started from Basic etc. without loading (POKE 54017,0 or X=USR(64647)).

"Ramtur Copy" - a TURBOdatarec. copy prg. using ramdrive. You can load files up to all memory and save all after it. It's placed "under ROM" also.

I have everything what I wrote about, but I lost a prg. for transfering files ATARI->PC.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <144246@cup.portal.com>
Source record: 88884

Chris; I share some of your thoughts about ZIP for 8 bits. The older
PKUNZIP.COM files I have are only about 18k. Figure if you eliminate
the code that is superfluous like [extract to screen, recreate directories,
...] & I can't see the code taking up anywhere near 18k on an 8 bit.
I believe the code tables, I may be confusing this with LZW, contain
an definititions or simple look up tables. 14 bit tables would be equivalent
to a dictionary with 16k words. Most of these words are small, 3 or 4
characters, i.e. for something like "there are the three" there would
be a index code into the dictionary that would point to "the" "re" "ee"
so it would compress to something like "<index to "the"><index to "re ">
a<index to"re">... I haven't read all the rules, for instance I think
bye definition the first 256 characters in the dictionary are 8 bit
values or some such thing, but it's hard to believe you can't fit it on
an Atari. I frequently shell out from a terminal program to extract
a zip file & I seldom have more then 360k of free space left. Ditto if
I shell out from SIO2PC & all the ram is taken up by disk images. I'm
pretty sure I've gotten PKUNZIP to run with only about 128k available.
If people be a little more specific about just what the memory problems
are, it would help.
Rick

Pin 9 is NOT an output of the PC, it's an input. The reason why you see the -9v there is all inputs are usually pulled to either V+ or V-, that way when you have nothing connected to the com port, the machine doesn't get confused & think the phone is ringing<g>. As far as the unused gate on the MAX232 chip goes, good eye! What can happen if you leave gates open is they go into oscillation with themselves. I've heard of at least one case, old Sanyo 550 MS DOS computer, where this oscilation can go into the 10s of MHz & cause huge power drains/chip failures. You wouldn't want to connect the output on an inverter to the input of that same inverter though. Just wire the input to either ground, 5V, V-, or V+ & leave the output pin open to avoid any problems. The band on the diode is equivalent to the out arrow i.e. ***:* on the diode is ---:>-- on the schematic.

You said TTDOS was better than SpartaDOS.

Does it do time/date stamping? Subdirectories? Hard drive and other
large-floppy access (up to 16MB for example, with SpartaDOS).

Is it compatible with Atari DOS (MyDOS is, feature-wise, identical to
SpartaDOS except it is Atari DOS compatible (file system and memory (mainly)),
except it doesn't do time/date stamping).

: > project, APE (The Atari Peripheral Emulator) version 1.04 is ready
: > for public release!
:
: hoo-rah! sounds very cool. I'm thrilled to see this sort of
: development for the atari...
:
: A few questions about your product:
:
: Is source available?

No.

: Is it possible to add in new devices to be emulated, if someone were to
: want to (without source editing & recompiling)?

So far im upto R:, P:, Atari D:, Happy SIO, Supermax High speed, Us Doubler,
and a new high speed variant. Im not sure what other SIO devices there
are to emulate, but if there is a signifigant need it would be possible to
create a kind of SIO 'lincon-logs' kit for defining device responses.

: And the main thing: Is it possible to get this to run under NetBSD (UNIX)?

I doubt it, unless you run a DOS emulator that can handle a program banging
on the com ports.

: I have no DOS systems running in the house right now; I would prefer not
: to have such creatures around, on moral grounds... :)
:
: This is the main reason I ask about source. What language did you
: write it in?

Borland Turbo Pascal 7.0 and Turbo Assember.

: I am very certainly going to have to have a look at this system

It still has not appeared at atari.archive.umich.edu, so anyone interested
in the shareware 1.04 still needs to e-mail me for a copy :) 1.05 is
coming along and includes some new com routines, a built in dcm->atr
converter and a few other new goodies.

There may also me a new revision of 1.04 to resolve some serial bugs. Anyone
who was tested the modem functions please let me know how they performed
for you (or didnt perform :).

Hi, and welcome to Ch.A.O.S. Country. Welcome to the revolution. The Cheyenne Area Orphaned Systems, or Ch.A.O.S., is a club devoted solely for the preservation of classic non-IBM systems, such as ours, and for the defeat of Microsoft. If we wanted IB
M compatability, we would have abandoned our systems long ago. Those of us who do have IBMs, but still use our classics, only bought them out of necessity, such as for work or school.��This is not a political organization. We do not hold any specific r
ight wing or left wing political views. We do believe in fair competition and Microsoft is NOT fair. We spent all that time and money on our respective systems because the performed the task or tasks we bought them for. Wether it be for gaming, educat
ion, office, or whatever, our classic systems performed upto our expectations, and in some cases, beyond the original design. Why should we abandoned everything we put into our systems?��I have been working on the designs of two programs that I feel wou
ld unite all of our systems, yet retain the sovereignty or flavor of each individual system:��1. A terminal shell with game maker to allow two or more non-compatable systems to play games over the modem or in a mini-network. Of course, standard protoco
ls will have to be set between computers to ensure game play. But, graphics between two different systems wont have to be the same because screen data wont be sent, just tiny info packets. The games would take full advantage of the graphics and sound c
apabilities of each individual system. The games would be played as close to real time as possible.��2. A DEVICE OPERATING SYSTEM (DOS) desgined on a bi-level format: The primary level is a whole new computer that provides cross-platform compatability
between our classic systems. The computer will be based on the PowerPC. This will allow each classic system to be enhanced to that of at least a 486. Without losing much compatability with the existing sytems. Full compatability is not guaranteed be
cause of the new enhancements to each individual operating system. But, at least you wont have to abandon your whole classic system! The secondary level is a whole new disk operating system for the original classic. This will allow direct disk access
communication between ALL systems. Yes, even IBM. Just imagine, a C64 computer operating system with 38k free RAM, can now have as much as 3.75 Meg free RAM on a 4 Meg System! This is directly accessable without bankswitching or even use as a RAMDISK!
Just imagine the fresh, new applications that can be developed that retained the original C64s flavor. No, this is not limited to the C64, but to all classic systems, such as the Atari, Tandy CoCo, VIC20 (YES!), Apple, etc.��All of our classic systems
have their own uniqueness, their own distinctiveness. That is why we refused to follow the industry or marketing trends. This would allow us to preserve our systems and at the same time develop a cross-platform industry standard. Who says we have to
follow the Microsoft standard? Lets follow a standard, sure, but we should also be allowed to keep our systems we have devoted so much time and energy into!���Cheyenne Area Orphaned Systems�c/o Jeffrey Wood�813 Covered Wagon Drive�Cheyenne, Wyoming 820

I remember that you can't just send a BASIC listing to the printer. First,
all the ESCAPE codes cause havoc as do a few others. Second, some of the
extended characters will not print the same character. You need a special driver
installed. It was called 'G:' . Came from a Atari Magazine way back in about
1982 - 1983. With this driver installed, you could send the LISTING to G: and
then it was sent to the printer in graphics mode.
Look around for an OLD program called something like 'G:' or maybe
'GPRINT'. Something like that.

Agreed!!!
I just sent out my money to Chris for Rainbow, and I now I guess I need to
purchase an 850, so I can move over all my Atari stuff to my mac. I
DEFINITELY see a need, and would purchase a kit from someone if they made
them.

My 9500 _needs_ to have my 800xl attached to it. It's begging for it!

Source record: 88900

Well, hopefully someone will compile a copy of DCM2ATR to work on the Mac.
Also, I'm pretty sure the unregistered version of Rainbow supports inclusion
of raw files, just like PC Xformer, except it's done differently (they are
added to the current D1: disk, if there's room available). I kind of hope
this method changes, since sometimes D1: is pretty full and I don't want
to go through all the trouble of finding or making an emptier disk image
just to, say, extract files out of an ARC (which will then be deleted
off of my drive!)

Anyway, perhaps when I get some time at school and get used to Code
Warrior, I'll see if I can get DCM2ATR working on Mac's...

Arghhh! Okay, so here goes... My Pee-Cee is down. I'm using my 800XL
to get on here. I'm having a rough go at constructing a WWW homepage.

Is there any kind person out there who can help me (i.e., do it for me)
with making one? Someone with Word For Windows or Netscape? I'd supply
the text, links and gifs, and you do the construction? I want to set up
a homepage for my club NWPAC.

Thanks in advance.

: maintain said table ON DISK instead? We DO have note-and-point "random ac-
: cess" to disk files, after all. Just instead of referring to code-table-array
: elements a la

Yes, this is the main problem. But only Sparta has fast relative note
and point. That's why you have custom disk structures with index files
for stuff like Diskbase, to get around AtariDOS/MYDOS' lackings. The
only fast note and point with MYDOS is absolute sector/byte offset
addressing.

2331. XE Game System HELP!

Ive been unable to locate a copy of Syncromesh, the software for the enhanced Indus disk drive. If anyone still has a copy of this laying around please let me know, I would love to get a copy to test on APE.

Thanks

Steve

2333. Need more help on ULTIMA III

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-27 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.809487283@gmi.edu>
Source record: 88905

Thanks to all those who responded to my first post about Ultima III, the help was very useful.

However, now I'm in need of some more help (pretty pathetic, huh?)

I am now in Exodus castle. I have found what appears to be the panels with which I am supposed to insert the cards into. However, I cannot get across the bridge because the floor panels continuously attack, not even allowing me one move.

So, what do I do to get to the panels? Or, is there some other strategy I should try in this castle to win the game? I've been in there several times, and I can't figure this out.

Any help on this last hurdle in Ultima III will be appreciated.

/Kevin

** Atari 800 Computer Equipment for Sale **

1) Atari 800xl Home Computer, w/1050 Disk Drive. Includes Disk Drive Cables, And Both Power Supplies. Also includes RF cable for TV hookup. I picked this up at a School auction so it has some serial numbers, and some small tape scarring. I did test both the computer and the disk drive, and they both seem to work fine.

Price $60 (Includes Shipping)

2) Atari 1050 Disk Drive w/Power Supply. (Same info as above)

Price $25 (Includes Shipping)

3) Atari 800xl Power Supply (Tested)

Price $5 (Plus Shipping)

** Misc **

I have quite a few sets of the above. I also have printers, misc. cables, basic carts, and other misc. atari 800 stuff.

** TRADES **

Willing to accept almost anything in trade that relates to classic computer and/or video game systems, or for 800 carts/disks, etc! Thanks!

Send mail to numsix@gate.net

Thanks!

2335. Bitter Reality, ok on XE/GS?

Kevin; Believe it or not, if you try to leave Death Castle without breaking Exodus, the grass attacks you the same way! I can't rememer for sure, but I think there may be two waves of floor attacks. The best way to take care of it is by having at least 2 mass damage spells worth of points left. Next to that, a defensive position something like:

```
**********
* *
* *
*xxxx *
**********
```

Works fairly well. Just wait until you start getting attacked then return fire. In general most of the enemies will end up straigth in front of you so you won't walk into an area where you will be surounded & attacked. When you do move forward vs hitting an opponent, attack sideways to clear out the last floor tiles.
Rick

You will fight (I think) three groups of floors and/or grass. You will
not see them. Your best bet is to back up, close ranks tightly (all four
characters lined up together) and keep attacking straight ahead until all
eight are dead. (You *do* have Exotics, don't you?)

I always stayed more in the middle, but yes, *definitely" move to the back rank and move close together--this way, none of the attackers will hit you from the sides. They'll be straight ahead, where you can whomp them.

If you have a cleric, make sure you have at least 70 magic points left. Wizards should have at least 75. That way, they can both cast their most potent offensive spells. But I save them for dragons/wyverns/griffons and balrons/devils/????? (what was their 3rd name?).

And having a horse is nice, too; you can avoid several battles by outrunning groups of would-be attackers.

: Works fairly well. Just wait until you start getting attacked then return

Yep. That's why it's best to back up, move together and wait for them to move *right at you*.

-Atari Keyboard Controller

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction will end on Sunday, September 3, 1995 at
Midnight Mountain Time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be ATARI BID .

5. Minimum bids will be $1 and bidding increments will be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50 for each additional cartridge. Shipping and handling for systems will range between $6 and $10.00 depending on weight. Larger systems may be more. All cartridges and systems will be shipped through the US Postal System anywhere in the Continental US. Other areas will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted. Payment MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased from this auction. Cartridges have been tested and do work, unless otherwise specified. Most systems have been tested and do work. The systems which may not work are the ones without cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent to follow these rules as stated.

It could be a bad disk image. I know your APE program doesn't like
Bitter Reality, but SIO2PC does. It worked fine with my NTSC 800XL,
and even better with my PAL 800XL.

I heard from Itay Chamiel that "I'm lucky it works at all with SIO2PC"
because he said it uses some very funky disk I/O routines- he knows this
because it complained to him "Use a 1050!" when he tried loading it from
some other disk drive.

I could send you a copy of the working ATR I have, if ya want! :)

Yeah, I have exotics, all the marks, all the cards. I know there are at
least 2 rounds of attacks, because I went that far and then thought
that maybe it just went on forever (and that there was some other
thing you had to do to get through).

Ok, I'll try it again, now that I know what this is about. Thanks
everyone for the help and hints.

I downloaded the source code to ST-xformer version 3.0. If you are
interested in what it takes to build an emulator, it is something you
might want to look at. It is available from one of the pages of Brasoft.

Yes, some versions of 'util' come with some source code. One part of it is an
assembler source and I think there's another part in 'c'.

Unfortunately the name of the archive the source is in escaped from my memory,
but you can find it on umich and its mirrors. As I vaguely recall there was
some statement as to the status of the source inside the archive. C. Marslett
called it PD, but don't nail me to this, it's been a very long time since I've
looked at the code.

Hope this helps,

-Marek

Why do you need Netscape or Windows to do your home page construction?
All you need is to run Lynx from off your *nix account while dialed up
with IceT or FlickerTerm.

Since you said you already have the GIFs/etc. to put on the thing, it's
not like you'll need a paint package for the XL. :)

I've done all of my home page stuff for the past 3 months without EVER
getting a chance to look at it with Netscape.. and I simply edit it all
up under emacs (no big hefty word-processor here!)

Hmmm - I just had a thought!.. DD3 text -> HTML ... oops, that's
another story though!

Source record: 88927

Allan; You aren't running it with any form of OS/2 or Windows are you?
If you are, you may be able to 'barely' get it functioning in a full
screen DOS window, but that's about it. SIO2PC works best under some
flavor of DOS like 3.2-6.2 versions. The main problem in my guessimate
is Nick Kennedy used the ring indicator for signaling the Atari wants
some data. I'm checking the schematics for an IBM serial port right now,
& I'm not sure if that particular line is the best choice. For instance,
I believe the CD has the highest priority & can generate an interupt
regardless of what else is going on with the 8250.

From: riebman@eskimo.com
Message-ID: <DDzvrK.91E@eskimo.com>
Source record: 88928

Greetings All

I recently picked up an Atari 800 and a copy of
the old Atari Editor/Assembler cartridge. I have
some old cassettes with programs on them that I
saved many years ago using the Editor/Assembler
cartridge. So I want to read them back from
tape. But the Editor/Assembler didn't come with
the manual and I've forgotten the commands.
Does anybody know the command to read from cassette?
Is there any information on the net about using
the old Editor/Assembler? Are there any books
that cover the Editor/Assembler? And last, but
hardly least, could some generous person send
me a list of some of the commonly used commands
and assembler switches?

Thanks very much.

Bruce Willard (bwillard@mindspring.com) wrote in comp.sys.atari.8bit:
>Remove the plastic cover over the start, pause and reset buttons.

This is IMPORTANT. If you don't do this before opening the joystick, you could ruin the flex circuit. There are two types of covers. The "tall" kind needs to be opened from the side with a small screwdriver, but the more common 45 degree kind can be opened with three or four fingernails and a bit of practice. There are enough broken sticks that I throw all my tall covers into the spare parts box.

BTW, for 5200 stuff, check out rec.games.video.classic instead.

2362. Atari Support number

Hey !

Is anybody able to tell me what the video signals
on the Atari Monitor connector exactly are (there
are three of them) :
-) composite luminance (used for monochrome monitor)
-) composite video (used for color monitor)
-) composite chroma (?)
I'm also interested in the former connector standards
(I only know a european standard I think which was called
FBAS for a color monitor with two cinch plugs. One for
video the other for audio).
I saw that the Amiga Monitor 1083 or so uses FBAS too.
Does this mean that I can use this monitor with my ATARI?
Can I connect every FBAS monitor to my ATARI or do I have
to take into account special specifications (frequencies,
resolutions,...).
I also saw an very old announcment of an philips monitor
which could be connected to the Amiga or to the Atari ST.
Does that also mean that I can connect a Atari ST monitor
(SM124 or SC1224) to the 8-bit brother?
I would like to know what connectors and signal-types (FBAS?)
the Atari ST Monitors are using.

Thanx for your time to read this,
mario

The problem with double-sided DCM files is that they'd be too big to
store on a standard floppy - which is one of the reasons DCMs are
compressed, and also is the reason you can break them up into peices.

Also, if you become a programmer, I suggest MAE, Action! and TurboBASIC XL.

Help!

Im having problems using SIO2PC with Double Density disks.

If I 'load' a DD disk and try to via it through my 800, it tells me there are 0000 sectors free. If I create a DD disk through my 800 and try to view it under xf3.0a, it tells me there are 0000 secotrs free. I can view these disks under the 'computer' they were created on(ie, ones created under xf3.0a work fine)

Any help appreciated

Also,
I have alot of originial software I would like to run under xf, but there is copy protection on the disks. Is there something I can buy that will 'unprotect' these? Specifically, Id like to get my Ultima disks converted (II, III, IV)

Please respond via EMAIL

Thanks
Steve

I believe I was one of the first people, if not THE first person, if not
the ONLY person, to put 'Util' on Umich. At the time -I- posted it, yes,
it DID come with source code. The mainline is in C, and the low-level I/O
is in assembly.

2369. Idea for .ATR format

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-28 00:00:00 UTC
From: rziegler@sover.net
Message-ID: <41rkc3$olt@thrush.sover.net>
Source record: 88941

Hello all, I just had an idea that could help unclutter IBM directories. I am tired of having two disk images for disks that were originally "flippies". Could we add a new .atr format that would contain both sides of the "flippie" in one file? It seems to me that it would be easy enough to implement. Perhaps an option in APE or SIO2PC that would "flip" the disk. We could press "F" or the key associated with flipping the disk and be prompted with the drive # to be flipped. That is a heck of a lot easier than swapping images all the time, and could un clutter our directories. A similar enhancement could be added to the dcm format; when the first sides end is reached, Disk Communicator could ask you to flip the disk. Can Bob Puff be bothered to do this though? Or should somebody else pick up the ball?

I'm not a programmer (yet :), but I've seen a lot of innovation in this group the past few months and I'm sure the people here are capable. Anybody else find this interesting?

> Anyone know how to reassemble a 5200 joystick?

>Eric B.
>ericb@esl1.tamu.edu

I just did it the other day.

Remove the plastic cover over the start, pause and reset buttons.
Turn the joystick stick down.
Line up the pegs on the potentiometers so that they look as if they are ready to go in the holes of the sliders.
put the bottom cover on slowly, and jiggle it a little, while feeding the plastic strip through the slot to the top of the joystick.
At this point, I usually load in missile command to make sure I have control in all directions.
Screw down the cover.
Now lie the plastic strip flat and push the cover over it until it locks in place.

Good Luck. I've seen few things as prone to breaking and as difficult to get back together!

Yes, forlks I have a P:R: Connection new in the box with docs and
everything for $40 or best offer.

I *REALLY* would rather trade it away for some cartridges I don't have or
something like that.

Let me know!

I also have a complete 400/800 Soucre Code listing for sale $10 plus shipping

2376. River Raid

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-29 00:00:00 UTC
From: p2kamins@undergrad.math.uwaterloo.ca
Message-ID: <DE36t7.9MI@undergrad.math.uwaterloo.ca>
Source record: 88806

Where on the Internet can I find game River Raid? I'm using PC Xformer 3.0, so I cannot use cartidges, but if someone would sell me the disk version (he would also have to transfre it to PC diskette because I don't have access to Atari disk drives).

2378. Formatting single density

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-29 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug29.194818.25795@wariat.UUCP>
Source record: 88808

Marek Tomcyk has been most helpful in information about
sector 'skew's or sector ordering for formatting a A8 disk.
I'm looking for a RELIABLE way to read/write/format single
density A8 disks on the pc. Altering the sector skew just
seems to effect the speed at which A8 and pc drives find
given sectors, due to the timing I guess. Here's my
question:
Is there an optimum sector skew and most importantly
inter-sector gap for formatting disks on the pc? I'm about
to give up. I've used a box of 25 disks experimenting and
still haven't gotten reliable reads on either the A8 or pc.
(Where's R. Dell when you need him?) Any one? Please jump
in or e-mail me.

j >8bit computing?
j >
j >I just bought one, and havent had any luck installing it in my upgraded
j >XE so far.. works great in my stock XL, but since theres no ramdisk
j >in that machine, I cant try out or take advantage of the built in
j >ramdisk handler(s).

Howdy James

I have one in my 130XE (I had somebody install it for me years ago (he wrote
the date on the inside of the case, lemmy see. 160189 it sais. Which would
be January 16th 1989 )). If somebody wants to take it out, (s)he'll have
to fight me to the death.

I really like it, if it wasn't as expensive, my 800XE would have one too.
I use MyDOS 4.53/3 and don't really know if and how the US+ RAMdisk handlers
work.

I do like the fact that;

- Option is reversed (Boot WITH "Option" to enable BASIC)
- Most of the function keys the 1200XL had, are available. With the standard
keyboard (no-mods)
- With all DOSses except Sparta (except 4.2 I hear) you can swap drives.
- One extra switch makes it possible to Boot from your RAMdisk (don't have
that one)
- The cursor moves faster (can be disabled)
- On board XL/XE OS
- On board 400/800 OS (can eve be copied to RAM if need be)
- On board MachDOS (a mini-mine DOS, you don't need a separate DOS)
- Cold-Boot without switching off the power. And if your DOS allows it, even
without losing the contents of your RAMdisk.

That's just what I know of the top of my head.

O yeh, if you want to get rid of it, I'll exchange it for $25 bucks incl.
postage :-)

b >the FF. Normal run address load vector into E) and E! at the end. Does Mydos
b >use a different name for it's autorun.sys file? I couldn't find one in the
b >manual. Anyone?

Howdy Ben

Don't know if it's MyDOS 4.53 or RB6C.* but on my system, I have to use
the following:
FILENAME.ARx

Where x is 0 to 9. Start with 0 and don't jump over a number.

Isn't that the way SmartDos also uses it's AutoBoot files.

So what used to be AUTORUN.SYS now read like e.g. ROM2RAM.AR0

I like this system.

From: cbbrown@io.org
Message-ID: <4209ob$moq@ionews.io.org>
Source record: 88821

Efficient algorithms for processing Ziv-Lempel compressed data generally
use hash tables to store the information about the expansions that are
in use.

In order to get both:
a) cross-references to other codes, and
b) references to character values,

the 14 (or up to 16) bits require a couple or 4 bytes of storage apiece.

The compression schemes in use are generally designed with the assumption
that you've got 64K of RAM to use as a hash table.

And that's the whole of the problem. A 6502 only has 64K of addressable
RAM altogether. Bank switching can alleviate the problem slightly, but
the scheme *really expects* that you have 64K of RAM to burn. If you
don't, as is *certainly* the case for a 65XE system or less, then life
gets a whole lot more difficult.

With a hard drive setup it is too easy to forget. But what about the
atr? They would mostly be used on a PC, and a program to create a
"double sided" .atr from two .dcm files could be written. That should
be the easy part compared to deciding on file format etc. Is there
even interest?

2600/5200/7800/400/400 ATARI AUCTION DAY 7

WELCOME TO THE ALL ATARI AUCTION

The 2600 cartridges have been sorted by company name and
alphabetically. If you are interested take the time to go
through the lists and send me a bid for everything you want.

This Auction will end at Midnight Mountain Time on
Sunday September 3, 1995

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $4.00 bnohj

Atari 2600-LOOSE GAMES, COLORED LABEL NO PICTURE

-Air-Sea Battle: cx-2602

-Backgammon: cx-2617 $2.00 rhett

-Basic Math: cx-2661

-Basketball: cx-2624

-Brain Games: cx-2664 $1.00 rfulton

-Championship Soccer: cx-2616

-Football: Atari

-Golf: cx-2634

-Hunt & Score: cx-2642 $1.00 lonadar

-Popeye: Parker Brothers: W/ box & Directions $4.00 luis

-Space Invaders: CXL4008 $4.00 luis

-Star Raiders: CXL4011 $2.00 min

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for them,
but I will not guarantee that I find them. Shipping will vary
depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari 2600 jr, no cables not working

-Atari 5200, 4 port, manual, switchbox and joysticks, no power supply
$46.50
gmofley

-Atari 800XL w/ power supply $15.00 luis

-Atari Keyboard Controller

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction will end on Sunday, September 3, 1995 at
Midnight Mountain Time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be ATARI BID .

5. Minimum bids will be $1 and bidding increments will be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50 for each additional cartridge. Shipping and handling for systems will range between $6 and $10.00 depending on weight. Larger systems may be more. All cartridges and systems will be shipped through the US Postal System anywhere in the Continental US. Other areas will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted. Payment MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased from this auction. Cartridges have been tested and do work, unless otherwise specified. Most systems have been tested and do work. The systems which may not work are the ones without cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent to follow these rules as stated.

It will load from floppy. It will not be that slow. The OS will NOT require 1meg
of banked RAM. The OS will work on a 6502. A hard disk will be OPTIONAL.
(I think I got everything there).

In short, it should run decently on a 130XE or better with at least a floppy drive.
I don't think that's too much to ask.

Buying a PC to emulate an Atari 8-bit is not an acceptable solution, in my opinion.
Fact is, I don't WANT a PC. I'm quite happy with my many Ataris and my Macintosh.
The reason I am considering this new OS idea is because I feel that there is
unfinished business on the Atari side of things. Atari's cool machines
have long suffered from a lack of software, and in the case of the 8-bit, the
computer never lived up to its potential. I'd like to see it do that -- and
it DOESN'T need help from a PC.

2404. Rainbow an M.U.L.E. HELP!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-30 00:00:00 UTC
From: fnjah@aurora.alaska.edu
Message-ID: <421bqm$9pc@news.alaska.edu>
Source record: 88826

I got the demo version of Rainbow and the 800 OS. It runs all the demo stuff and I got it to run Donkey Kong, but it won't run anything else. It either just shows a black screen as with Jumpman, or shows a title screen and then crashes as with Ms Pac Man.
What I really want it for is to run M.U.L.E. which the demo version should run. I have a disk XFD image of MULE, but it won't accept it. It says it is only supported in the shareware version. I changed it to an ATR type and it still doesn't work. I bought MULE for my atari years ago and still have the disk. But I have no way of getting the image to my mac. Could somebody please mail me a UU encoded disk image that Rainbow will be able to read? I would like to see how mule runs before getting the full program of Rainbow.
Any help is greatly appreciated.
Jim (fnjah@aurora.alaska.edu)

2405. FOR SALE (UK ONLY)

2407. Still more 'util' stuff

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-30 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug30.163752.28622@wariat.UUCP>
Source record: 88829

(Nobody commenting except Marek, but I'll give benefit of my
experience.)
From what I've learned so far, I know I could use 'util' more
effectively, and maybe Rick Cortese's 'mule'. I don't know mule,
haven't tried it. The FAQ says it is a 180k transfer utility.
Anyway, use a FRESH, 2s,2d disk, (not hd). Or, do like I do on already
formatted, experimented on, disks and put the disk inbetween a couple
of very strong electromagnets (mine's hooked up to a model train
transformer). Anyway, a FRESH disk. And format USING THE PC, not the
Atari drive (1050 or whatever.) You'll probably get good results using
'util' and maybe 'mule'. If 'util' does 'snarks', that is you can hear
the head repositioning, forget it and start over.

>deleted .rom files from subdirectory with XF 2.5, where all package was
>installed, nothing has changed - program worked well also without .rom
>files. Hence, my question is: for what are they there, then?

Like in some earlier versions of ST Xformer, the idea of the .ROM files
is to allow the user to patch Atari BASIC or the OS with custom code, in
much the same way people copy their Atari 800XL ROMs into RAM and apply
patches. For example you can dump any 8K cartridge to a file and rename
it to ATARIBAS.ROM and then Xformer will boot up with that cartridge
instead of with BASIC. Or change the READY prompt to something else.
Etc.

After releasing PC Xformer 2.0 and getting absolutely ZERO feedback
from anyone regarding any cool modifications they made I decided to
nuke the files in the later releases to reduce the size of the ZIP file.

The feature is still in there, and certainly anyone who has the
technical background to modify BASIC or the OS has the know how on
creating the files in the first place (you just write a one line Atari
BASIC program to dump BASIC or the OS to a disk file).

So to answer your question, if you don't know what to do with the files,
you don't need them.

2411. More A8 & pc format single density

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-30 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Aug30.104603.28212@wariat.UUCP>
Source record: 88833

(I sent the following two msgs. to an address I had for Richard Dell.
The msgs. bounced so I'm posting here. Marek Tomczyk also said post my
questions here.)
Marek Tomcyk has been most helpful in information about
sector 'skew's or sector ordering for formatting a A8 disk.
I'm looking for a RELIABLE way to read/write/format single
density A8 disks on the pc. Altering the sector skew just
seems to effect the speed at which A8 and pc drives find
given sectors, due to the timing I guess. Here's my
question:
Is there an optimum sector skew and most importantly
inter-sector gap for formatting disks on the pc? I'm about
to give up. I've used a box of 25 disks experimenting and
still haven't gotten reliable reads on either the A8 or pc.
(Where's R. Dell when you need him?) Any one? Please jump
in or e-mail me.
(Msg #2)
Mr. Dell,
I hope this gets thru to you. I sent a previous message
asking for info about single density A8 disks
reading/writing/formatting on a pc. I thought if I told you
some of what I learned experimenting that you might have
some insight.
I get reliable results double density formatting on the pc
with the sector skew from C. Marslett's 'util'. I do change
the inter-sector gap for read/write and format from
Marslett's 28 and 24 to 14 and 24.
Now I'm trying to get reliable results in single density.
Again, the pc will not find the address mark (track) of an
A8 formatted disk. My best results are formatting single
density on the pc using the same sector skew and
inter-sector gaps as for double density. I just change the
bytes per sector parameter in the disk base table. The pc
will read the sectors up to 16 reliably. At 16, the pc has
trouble finding the sector. The Atari will read the first
18 sectors, but then doesn't move the read/write head for
the next track and can't read sector 19. Thanks, Russ

2600/5200/7800/400/400 ATARI AUCTION DAY 9

WELCOME TO THE ALL ATARI AUCTION

The 2600 cartridges have been sorted by company name and
alphabetically. If you are interested take the time to go
through the lists and send me a bid for everything you want.

This Auction will end at Midnight Mountain Time on
Sunday September 3, 1995

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

ATARI 2600-NEAR MINT W/BOX & DIRECTIONS

-Combat $3.00 min

-Missle Command $3.00 min

-Pac Man w/ Atari Pac Man Sticker on Box $4.00 bnohj

Atari 2600-LOOSE GAMES, COLORED LABEL NO PICTURE

-Air-Sea Battle: cx-2602

-Backgammon: cx-2617 $2.00 rhett

-Basic Math: cx-2661 $1.00 allan

-Basketball: cx-2624

-Brain Games: cx-2664 $1.50 kcwillia

-Championship Soccer: cx-2616

-Football: Atari

-Golf: cx-2634 $1.00 kcwillia

-Hunt & Score: cx-2642 $1.50 kcwillia

-Indy 500: cx-2611 $1.00 kcwillia

-Outlaw: cx-2605 $1.00 allan

-Space Invaders: cx-2632

-Space War: cx-2604

-Surround: cx-2641 $1.00 ltravis

Atari 2600-LOOSE GAMES, COLORED LABEL W/ PICTURE

-Adventure $1.00 bdoug

-Asteroids

-Basketball*

-Breakout $1.00 gjpaters

-Circus Atari

-Demons to Diamonds: Atari $1.00 kcwillia

-Dodge em $1.00 rhett

-Football

-Golf

-Home Run

-Indy 500

-Math Gran Prix $1.00 allan

-Missle Command

-Pac-Man

-Space Invaders

-Space War

-Star Raiders

-Warlords $1.00 rhett

-Yars Revenge

Atari 2600-LOOSE GAMES, SILVER LABEL W/ PICTURE

-Battlezone $1.00 bdoug

-Centipede $1.00 gjpaters

-Dig Dug: Atari $1.00 gjpaters

-E.T.

-Ms. Pac-man $1.00 gjpaters

-Phoenix $1.00 kcwillia

-Pole Position $1.50 gjpaters

-Realsports Football

Atari 2600-LOOSE GAMES, M NETWORK

-Football

-Frogs & Flies $1.00 bdoug

-Lock N Chase $2.00 rhett

-Space Attack $1.00 kcwillia

-Super Challenge Baseball

Atari 2600-LOOSE GAMES, ACTIVISION

-Grand Prix

-Kaboom $1.00 rfulton
Damaged end label

-Laser Blast

-Pitfall

-River Raid $1.00 bdoug

-Seaquest $1.00 lonadar

-Skiing

-Stampede $1.00 bdoug
-Missing end label

-Starmaster

Atari 2600-LOOSE GAMES, CBS

-Gorf $2.00 rhett

Atari 2600-LOOSE GAMES, COLECO

-Donky Kong

-Mousetrap

-Venture

Atari 2600-LOOSE GAMES, IMAGIC

-Atlantis $1.00 kcwillia

-Cosmic Ark

-Demon Attack

-Laser Gates $7.00 timg

-Riddle of the Sphinx $1.50 kcwillia

-Star Voyager

-Trick Shot $1.50 kcwillia

Atari 2600-LOOSE GAMES, PARKER BROTHERS

-Amidar $1.00 kcwillia

-Frogger

-Q*Bert $1.50 kcwillia

-Reactor $1.00 kcwillia

Atari 2600-LOOSE GAMES, SEARS TELEGAMES

-Gunslinger $1.00 bdoug

-Missle Command

-Race $2.50 kcwillia

-Space Invaders

-Tank Plus $3.00 keita

Atari 2600-LOOSE GAMES, TELESYS

-Cosmic Creeps $2.00 rpribish

-Fast Food $3.50 kcwillia

Atari 2600-LOOSE GAMES, US GAMES

-Piece O Cake $5.00 rpribish

-Space Jockey

ATARI 5200-LOOSE GAMES

-Centipede, w/ overlay

-Defender

-Galaxian, w/ overlay $2.50 gmofley

-Missle Command $1.00 bdoug

-Ms. Pac Man $2.50 gmofley

-Pac-Man

-Pole Position

-Qix, w/ overlay, w/ directions $2.50 gmofley

-Q*Bert
label is torn

-Real Sports Soccer, w/ directions $1.00 bdoug

-Soccer

-Space Invaders

-Super Breakout

ATARI 5200-BOXED GAMES W/ DIRECTIONS
*all boxes have some wear.

-Defender

-Qix

ATARI 7800-LOOSE GAMES

-Pole Position II

-Winter Games $2.00 rhett

MISCELLANEOUS CATALOGS
*all are in near mint condition

-ATARI FORCE Comic Book #2 $3.00 min

-ATARI FORCE Comic Book #3 $3.00 min

-ATARI Video Game Catalog $2.00 min

ATARI 400/800-LOOSE GAMES

-Atariwriter Word Processor: RX8036

-Basic Computing Language: CXL4002

-Defender: CXL4025 $4.00 luis

-Popeye: Parker Brothers: W/ box & Directions $4.00 luis

-Space Invaders: CXL4008 $4.00 luis

-Star Raiders: CXL4011 $2.00 min

MISC. SYSTEMS-
*some systems say no cables but if you bid I will look for them,
but I will not guarantee that I find them. Shipping will vary
depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS
WILL BE $1

-Atari 2600 jr, no cables not working

-Atari 5200, 4 port, manual, switchbox and joysticks, no power supply
$46.50
gmofley

-Atari 800XL w/ power supply $15.00 luis

-Atari Keyboard Controller

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction will end on Sunday, September 3, 1995 at
Midnight Mountain Time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be ATARI BID .

5. Minimum bids will be $1 and bidding increments will be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50 for each additional cartridge. Shipping and handling for systems will range between $6 and $10.00 depending on weight. Larger systems may be more. All cartridges and systems will be shipped through the US Postal System anywhere in the Continental US. Other areas will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted. Payment MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased from this auction. Cartridges have been tested and do work, unless otherwise specified. Most systems have been tested and do work. The systems which may not work are the ones without cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent to follow these rules as stated.

I assume you mean a game that asks for a disk change in mid-stream.
As far as I know, only the commercial versions (3.0, 3.0a, 3.2 or 4.0)
have that feature (as well as player-missile graphics, sound, etc).
I bought version 3.0 and am pleased. It's not perfect, but does a
good job for a reasonable price.

: decode it).
: But it's a BIG pain for everybody else.

: I'm certainly not saying that we should start using tar.gz for Atari
: stuff, just that we should be able to decode it.

Assuming you have tar and gzip on the local or remote system, you can do
several things to get around this without too much difficulty.

If the site is using wu-ftpd, on a file called "file.gz", you can "get file"
and it will decompress it on the fly.

If you have gzip locally, you can "get file.gz |gzip\ -dc\ >file" and it
will do the same thing. Note that the backslashes are necessary to make
the ftp client think it's all one command.

Similarly, with file.tar, you can "get file.tar |tar\ xvf\ -" to extract
the files as you download it. On "file.tar.gz", you can
"get file.tar.gz |tar\ -xzvf\ -" the produce the same results.

Converting the files to the .arc format is up to you, but there is a unix port
of arc available.

Anyhow, that concludes the "nifty FTP tricks" lesson for today. :)

...and my money is in the mail.

But in the meantime, what is the best way to get the entire M.U.L.E. disk
over to the Mac?
Or any game disk, for that matter? I have an 810 with The Chip (tm) in it,
will that help?

After 13 or 14 years I'm a bit rusty...

well mr. smarty pants, so maybe you're right. I do have access to a UNIX machine (ok, SEVERAL Unix machines.). I just would rather NOT use it. :) But if I have to, I shall.

Besides, I hope to avoid all that by just transferring directly all my atari stuff to my mac. I have a seller for an 850, now I just need to work on getting the right cable from the 850 to a mac, before I actually buy it from him.

Lyman

2419. ***Indus GT disk drive***

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-31 00:00:00 UTC
From: Jason Hedrick <102416.675@CompuServe.COM>
Message-ID: <4233adhqn1@mhade.production.compuserve.com>
Source record: 88841

Hi. I need help with the Indus GT disk drive. I've had it for a while,
and just got around to hooking it up to test it. It seems to work ok, except
for the following.
Upon bootup with SpartaDOS X, using its built-in INDUS.SYS driver,
the drive reads Ultra-speed Double-density just fine. However, whenever you
go to do anything to do with writing to the disk, such as formatting, it
slips into regular speed mode. The weird thing is, if you're formatting an
Ultra Speed DD disk, it writes the boot sectors and such in low speed, but
on another Ultra Speed compatable drive, the disk reads as Ultra Speed!
Of course, once the Indus slips into this mode, it won't read ultra speed
correctly, or write it.
If anyone has any idea how to correct this, PLEASE! Oh, PLEASE post a
message, or E-mail me, if you like.
Thanks,
--

Jason Hedrick

>
>PS I'm not hindered by knowledge, so please don't ask me how.

Yes, quite possible and Mike (FTE) did this for the MIO II. I asked Bob about this and he said that:

1) It would greatly slow down disk access (you'd have to read each 512k sector twice) for the current interface.

2) You could re-do the interface, but in all 16 data lines and either latch the two halves of the 512k sector, or use the second half of the sector as another drive (interesting...) but that would make the interface more complex. The return for the investment (more disk space) wasn't worth it in his opinion with the low cost of IDE drives at the moment and the rather small demand on disk space of most Atari programs. I have to admit, more than 20meg or so seems like overkill (except for a BBS) for the average user of an Atari 8 bit. But the idea will probably be worked out if there is demand for it. I don't even know how popular the idea of building your own IDE interface is to the general Atari community.

Bob still has my setup, when it's done (smart socket installed) I'll let you all know if this thing can cut it.

14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

Subject: 1.1) What is an Atari 8-bit computer?

In order of their release, the Atari 8-bit computers include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and the XE Game System. The 400/800 models were first shown publicly in November 1978 and first sold in 1979. The final machine, the XE Game System, was released in 1987. Atari Corp. officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM,

ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

GTIA is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

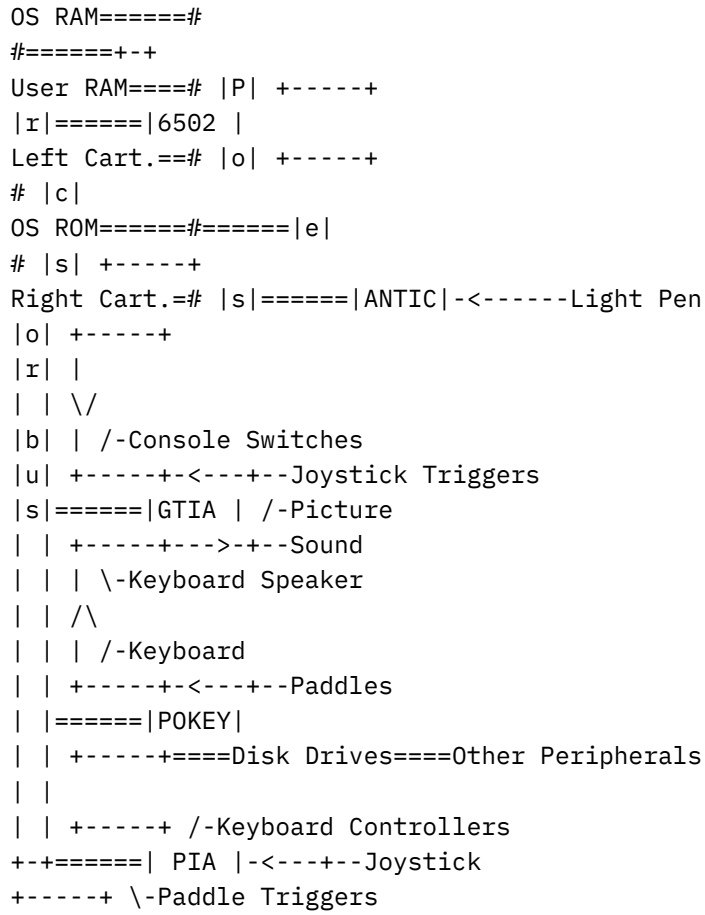
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexor. . According to mailto:masstorage@closer.brisnet.org.au (Masstorage), "Freddy is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. Freddy also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a freddy but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from freddy, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to freddy for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say freddy does the bank switching is beyond me. An 800XL

can look like a 130XE with that 16-pin chip installed (That's right NO freddy)
and an extra 8 RAM chips."

Hardware Arrangement



Beginners at using the 8-bit Atari platform may wish to contact Bill
Kendrick, mailto:kendrick@sonoma.edu, for his Newbie/Emulator FAQ.

The following is taken from Bill's Newbie/Emulator FAQ.
Graphics:
The Atari has maximum resolution of 320 x 192 (standard, non-overscanned
screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4,
160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4 graphics are also
supported. 40 x 24 x 256-character (128 normal, 128 inverse, character
set indirection available) text mode is standard (2 colors).
40 x 24 x 128-multi-colored-character (4 colors per character allowed,
the other 128 characters have 4th changed into a color 5) and
40 x 12 x 128-multi-colored-character screen modes are available.
GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16 hue-only,
and 80 x 192 x 9 color screen modes.
Graphics Modes Summarized:
Mode Horiz.xVert.xColors text/graphics
0 40 x 24 x 2 text
1 20 x 24 x 5 text

2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 2 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Normal (bordered), narrow (underscanned), and wide (overscanned) screen modes are available.
Screen modes can be mixed (by lines) down the screen using the Display List (a program which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris).
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt."
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

Sound:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

[I'd like more system spec's here.]

Subject: 2.1) What is comp.sys.atari.8bit?

If you have Usenet newsgroup access you can access this discussion group through news:comp.sys.atari.8bit. This is an unmoderated newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Info-Atari8 Digest and in INFO-A8.

comp.sys.atari was split into comp.sys.atari.8bit and comp.sys.atari.st in approximately 1986. To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

news:comp.sys.atari.8bit is archived by the INFO-A8 listserv.

Subject: 2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements. Moderated by Yat Siu from mailto:lexicor@world.std.com

----

Subject: 2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating for or against the various Atari computing platforms. If you enjoy making comparisons between Atari 8-bit and other computing platforms, this is the place to do it.

Subject: 2.4) What is comp.sys.atari.programmer?

news:comp.sys.atari.programmer is the unmoderated Usenet newsgroup for topics in programming on the various Atari computing platforms, including the Atari 8-bit.

Subject: 2.5) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

Subject: 2.6) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements. The moderator may be contacted at mailto:emulators-request@qualcomm.com

----

Subject: 3.1) What is the Info-Atari8 Digest?

If you have Internet e-mail access you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:atari8@netcom.com

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in INFO-A8.

Note that any posting sent to mailto:atari8@netcom.com will NOT be cross-posted to news:comp.sys.atari.8bit. The Moderator is presently working to correct this.

The Info-Atari8 Digest is archived by the INFO-A8 listserv.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The Info-Atari8 Digest Moderator is Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

Subject: 3.2) What is INFO-A8?

If you have BITNET or Internet e-mail access you can access this discussion group through INFO-A8.

The BITNET subscription commands are:
tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@vm.marist.edu where the message says
subscribe info-a8 <your real full name>

To contribute to discussion threads in INFO-A8, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu . Postings sent here automatically appear on news:comp.sys.atari.8bit and in the Info-Atari8 Digest.

Any postings sent to mailto:info-a8@vm.marist.edu or to INFO-A8@MARIST will not reach news:comp.sys.atari.8bit, so don't send your postings there.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST, or by sending a message to mailto:listserv@vm.marist.edu that says "unsubscribe info-a8". Please note that this command must NOT be sent to INFO-A8@MARIST nor to mailto:info-a8@vm.marist.edu .

The archive of comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8:

You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST or by sending a message to mailto:listserv@vm.marist.edu that says "index info-a8". These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or by using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Recent copies are also kept at ftp://ftp.kendall.mdcc.edu/pub/atari/info-a8/ (147.70.146.36) by Jason Duerstock.

The INFO-A8 Moderators are:
HARRY@MARIST (A Harry Williams)
mailto:ravi@mcnc.org (Ravi Subrahmanyan)
mailto:billw@score.stanford.edu (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Subject: 3.3) How can I access the Merit/UMich Archive by e-mail?

For more information on the Merit/UMich archive, see the section of this FAQ list on accessing this archive by FTP.

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send e-mail to: mailto:atari@atari.archive.umich.edu . The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less) and mail the result to mailto:lenn@atari.archive.umich.edu (Jody Lenn). Please

name the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

Subject: 3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line 1 help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

Of the mail-servers listed here, I recommend this "BITFTP" server. To help you
get started using it, try this example of retrieving files from the Merit/Umich
Software Archives (through the barnone.citi.umich.edu mirror site). Send a
message to bitftp@pucc.princeton.edu that says exactly:

```
ftp barnone.citi.umich.edu
user anonymous
cd /afs/umich.edu/group/itd/archive/atari/8bit
dir
cd Telecomm
dir
get ft80v037.txt
get icet.txt
binary
get ft80v037.arc
get icet.arc
quit
```

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

Subject: 3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

Subject: 3.6) How can I access the World Wide Web by e-mail?

Swiped from the WWW FAQ, which is maintained by mailto:boutell@netcom.com
(Thomas Boutell), here is how to access a web page by email:

mailto:server@mail.w3.org (preferred) or to
mailto:listserv@info.cern.ch (older address) containing
the following single line. (What you put on the subject line doesn't
matter; blank is OK. This line should go in the text of the message.)
You will receive as a reply a simple page intended to help you learn
more about the Web.

send http://www.earn.net/gnrt/www.html

Subject: 4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu ; the Atari Archive as a whole is
maintained by mailto:boydm@atari.archive.umich.edu (Mickey Boyd).

The convention for Anonymous FTP sites is to accept "anonymous" as your
username, and your e-mail address as your password. All of the
FTP sites mentioned in the FAQ list follow this convention.

Downloading (Try the site nearest you first)
----
a) ftp://atari.archive.umich.edu/atari/8bit (141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, United Kingdom)
d)

ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit
(128.193.4.2, United States)

f) ftp://barnone.citi.umich.edu/afs/umich.edu/group/itd/archive/atari/8bit
(141.211.128.22, United States)

g) ftp://phlem.ph.kcl.ac.uk/pub/Atari8bit (137.73.4.24, United Kingdom)

h) ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
(147.70.146.36, United States)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in ftp://atari.archive.umich.edu/atari/8bit/New

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the 8bit/New directory is "write-only."

Newly uploaded items may be found in the 8bit/Newitems subdirectory.

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no . PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Closer To Home Archive?

Here is a fairly large FTP site in Australia kept by
mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears).

ftp://closer.brisnet.org.au/pub/archive1/8_bit (203.4.149.97)

Support site for James Bradford's Super 8-bit Products including SuperDos,
SuperRam, Super800<->XL and much more.

Uploads go in ftp://closer.brisnet.org.au/pub/incoming

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is the hub system of the NPTN, the National
Public Telecomputing Network. It can be accessed by any of the following:
telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or
telnet://freenet-in-c.cwru.edu (129.22.8.32 or 129.22.8.51).
Type "go atari" to reach the Atari SIG.

Those who add their names to the Atari SIG user directories are
automatically members of the official Atari user group C.A.I.N. - Central
Atari Information Network.

The Cleveland Free-Net Atari SIG publishes the CAIN Newsletter, maintains
the CAIN Home Page on the WWW, and keeps the "Who's Who in the Atari
Community E-Mail Directory" listing. Send correspondence and press
releases to mailto:xx004@cleveland.freenet.edu .

Subject: 5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)

Type "go atari" to reach the Atari SIG. Write to
mailto:xx140@yfn.ysu.edu for more information.

Subject: 5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)

Type "go atari" to reach the Atari SIG. Write to Christopher Browne at
mailto:aa454@Freenet.carleton.ca for more info.

Subject: 5.4) What is the Closer To Home BBS?

Kept by mailto:Dave.Blears@closer.brisnet.org.au (Dave Blears), this is a
BBS in Australia which supports the 8-bit Atari.

telnet://guest@closer.brisnet.org.au (203.4.149.97)

Subject: 5.5) How can I access the World Wide Web by Telnet?

This section swiped from the WWW FAQ, which is kept by
mailto:boutell@netcom.com (Thomas Boutell).

An up-to-date list of these is available on the Web as
http://info.cern.ch/hypertext/WWW/FAQ/Bootstrap.html and should be
regarded as an authoritative list.

telnet://telnet.w3.org
A telnettable browser provided by the W3 coalition.

telnet://www@www.cc.ukans.edu
Offers Lynx, a full screen browser which requires a vt100
terminal. Log in as www. Does not allow users to "go" to
arbitrary URLs, so GET YOUR OWN COPY of Lynx and install it on
your system if your administrator has not done so already. The
best plain-text browser, so move mountains if necessary to get
your own copy of Lynx!

telnet://www@www.njit.edu
(or telnet 128.235.163.2) Log in as www. A full-screen browser
in New Jersey Institute of Technology. USA.

telnet://www@www.huji.ac.il
A dual-language Hebrew/English database, with links to the rest
of the world. The line mode browser, plus extra features. Log
in as www. Hebrew University of Jerusalem, Israel.

telnet://sun.uakom.cs
Slovakia. Has a slow link, only use from nearby.

telnet://www@info.funet.fi
(or telnet 128.214.6.102). Log in as www. Offers several
browsers, including Lynx (goto option is disabled there also).

telnet://www@fserv.kfki.hu
Hungary. Has slow link, use from nearby. Login is as www.

Subject: 6.1) How can I retrieve files from the Merit/UMich Archive through
Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I
personally recommend this method for downloading from the Merit/UMich
Archive.

There are also several mirror archive sites with Gopher servers:

gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit

gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit

gopher://gaia.ucs.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.
edu/atari/8bit

Subject: 7.1) What WWW pages support the 8-bit Atari?

Atari 8-Bit Computers FAQ and Vendor/Developer Lists
Michael Current, mailto:mcurrent@carleton.edu
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq.html

Atari 8-Bit Home Page
Ivo van Poorten, mailto:ipoorten@cs.vu.nl
http://www.cs.vu.nl/~ipoorten/Atari.8bit.Homepage/index.html

Atari 8-Bit Resort
Marek Tomczyk, mailto:Marek.Tomczyk@stud.uni-karlsruhe.de
http://www.uni-karlsruhe.de/~un55/8bit.html

Big Atari 8bit Home Page
Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl
http://www.uci.agh.edu.pl/student/airgrp/tatar/public_html/Atari/hp.html

Central Atari Information Network
Cleveland Free-Net Atari SIG, mailto:xx004@cleveland.freenet.edu
http://ace.cs.ohiou.edu/personal/mleair/cain.html

Rob Funk's pages
http://www.cis.ohio-state.edu/~funk/

CompuCat BBS
Neal Kinney, mailto:nkinney@netcom.com
ftp://ftp.netcom.com/pub/nk/nkinney/html/compucat.html

Classic Computer and Video Game Systems
http://www.gate.net/~cmwagner/atari8.html

Subject: 7.8) How can I access the Merit/UMich Archive by AFS?

If your local system supports AFS, this method of accessing the Merit/UMich Archive is a breeze.

Downloading

Just copy files from file:///afs/umich.edu/group/itd/archive/atari/8bit/

Uploading

Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

Subject: 7.9) What IRC channels discuss the 8-bit Atari?

#Atari8 - Just for 8-bit Atari users!

#classic - Classic Games and Systems Collectors.

Subject: 8.1) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at mailto:xx004@cleveland.freenet.edu .

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

Subject: 9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

Subject: 9.4) What is an .xmo file?

.xmo stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

Subject: 10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always (see companion Vendor/Developer List for complete contact info). A freeware 8-bit Atari emulator for the Atari ST.

Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer, from Branch Always (see companion Vendor/Developer
List for complete contact info). The 8-bit Atari emulator for
DOS/Windows/OS/2. Versions 2.0 and 2.5 are freeware; 3.0 is the commercial
version.

The following further info on PC Xformer provided by Bill Kendrick,
mailto:kendrick@sonoma.edu . Contact him for his Newbie/Emulator FAQ.

2.0 emulates an Atari 800. It requires about 300K of
free memory, 320x200x256 (MCGA/VGA/SVGA) graphics, and a 286 CPU.
It does not support ROM files, disk image swapping within the
program, player/missile graphics collision detection, sound,
PC joystick support, modem/printer support, but is free.

2.5 is the replacement for 2.0. It emulates either an Atari 800
or an Atari 800XL. It requires about the same as 2.0. It does
support ROM files and the PC speaker is used to emulate the old
Atari 400/800 internal speaker clicks. It is also free.

3.0 is the first commercial release. It emulates an Atari 800,
800XL, or 130XE (128K RAM; I heard it was to do 320K but I think
that was reduced). It requires a 386 and 512K of memory. It
supports Sound Blaster, player/missile graphics collision detection,
modem/printer and PC joystick support. It
comes with a disk with the software, an ammendum to the printed
documents, and a bunch of Atari 8-bit software (example programs:
demos/games, and a few useful utilities). It supports disk swapping
through a (currently) simple menu.

All versions support .XFD (Xformer disk) format disk images, and
all versions of PC Xformer support SIO2PC disk images (.ATR's).

PC Xformer 3.0 comes with a 36-page printed manual and reference.
It includes appendicies explaining graphics, sounds, colors, BASIC,
subdirectory paths (for MSDOS which in turn explains SpartaDOS/MyDOS),
a quick keyboard reference, ATASCII characters (all 128 drawn out),
the Atari editor, error codes, file IO (commands, devices, XIO calls)
as well as giving breif information on how to contact other Atari
users, common file extenders, and it includes a LARGE glossary
explaining Atari BASIC / TurboBASIC XL commands, Atari computer
terms, and general computer terms.

Merit/UMich: Xf2/xf2.zip, Xf2/xf25.zip

Of importance to PC Xformer users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into
SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
Merit/UMich: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
Merit/UMich: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
Merit/UMich: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
Merit/UMich: Telecomm/vt850b1.arc

FlickerTerm 80 0.37, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

Merit/UMich: Telecomm/ft80v037.arc

Ice-T 2.0 XE (requires 128K) or 1.1 by IceSoft (Itay Chamiel)
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.0 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.0 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.0 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation
Beta-test versions of both available from mailto:bruck@brachot.jct.ac.il

---

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - The latest version!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

HereZs some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (280-some rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind

- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
Merit/UMich: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
Merit/UMich: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:preston.f.crow@dartmouth.edu ,
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o

```
o o o o o o o o o o o o o
25 14
```

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

Major contributors to this section:

==> Atari 810
SS SD 19.2Kbps standard

==> Happy 810
SS SD Warp speed

==> Atari 1050
SS SD/ED 19.2Kbps standard

==> Happy 1050
SS SD/ED/DD Warp speed US Doubler/19.2 and 52k. track buffering

==> Super Archiver 1050
SS SD/ED/DD Ultra Speed 50+K

==> Speedy 1050
SS SD/ED/DD 78K mode (European) unknown DOS restrictions

==> Supermax 1050
SS SD/ED/DD 19.2k and 52k (ultra speed)

by Super products. Compatiable with superdos and US Doubler

==> Lazer 1050
SS SD/ED/DD Another Happy clone; Compatible w/ US Doubler

==> Atari XF551
SS/DS SD/ED/DD 38K burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

==> CSS XF551
SS/DS SD/ED/DD US Doubler compatible. Updates drive to work
better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit
y=2 -> a dual-drive unit

==> Percom AT88-Sy[PD]
where: y=1 -> a single-drive unit
y=2 -> a dual-drive unit
PD -> equipped with a built-in parallel printer port

==> Trak ATD1
SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS

from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 38000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2001
SS SD/ED/DD 19200 bps or 38000 bps

CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA-2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)

- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades
- Floppy Board

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==> IDE/AT-BUS hard disk (still under construction)

Subject: 12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

Of importance to SIO2PC users is:
DcmToDsk, freeware by Jason Duerstock. It converts most .DCM files into SIO2PC .ATR's for use with SIO2PC and PC Xformer.
Merit/UMich: Sio2pc/dcm2dsk2.zip

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Os/dos25.arc (DOS 2.5)
Merit/UMich: Fte/fte32g.arc (SpartaDOS 3.2)
Merit/UMich: Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs

600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)~same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer

XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have. I'm also not sure how much of this section is valid outside North America. If it's not valid where you are, I need to hear from you!

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010

Subject: 13.5) What BBS software can be used on the Atari?

This section by mailto:winston@merk.com (Winston Smith)

Here is the run down of ATARI 6502 8-BIT BBSes that I am aware of:

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

OASIS IV, CARINA, and BBS-EXPRESS-PROFESSIONAL! are all commercial
programs. I haven't heard anything about OASIS IV and CARINA for a while,
but PRO!-BBS is still a viable commercial enterprise last that I had heard.

Subject: 13.6) What version of Atari BASIC do I have?

Subject: 13.7) What are the Standards for Used 8-Bit Stuff?

Developed by mailto:b.poehland@genie.geis.com (Ben Poehland)

When selling used 8-bit Atari equipment in the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group, please consider describing the condition of the materials you are selling using these standards. This will go a long way toward preventing potentially highly-contentious misunderstandings. Usage is voluntary, but recommended.

LN (Like New)-- Item is pristine, unused, w/all manuals & original packaging materials.
EC (Excellent Condition)-- Item is little used, good working order, physically clean, may have a very few minor cosmetic blemishes, w/original manuals.
GC (Good Condition)-- Item is in good working order but slightly soiled, contains worn parts or minor scratches/dings that betray heavy service or old age, w/original manual or copied manuals.
FC (Fair Condition)-- Item in working order but missing manuals/accessories; heavily worn/soiled or cosmetically damaged.
BC (Basket Case)-- Item does not work, is damaged/butchered, missing manuals & accessories etc., but contains salvageable parts.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." The latest version may be obtained in the following locations, among many others:

>machine (ok, SEVERAL Unix machines.). I just would rather NOT use it. :)
>But if I have to, I shall.

dcm2atr is distributed with a DOS executable, as well, if you have
access to a DOS machine. It compiles under most UNIX systems, as
well. I don't know what platform you are using, but try and compile
the source, it is in C, and if you come up with any problems then let
me know. And if you can't find it, then look in
ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcm2atr*

There is a tar.gz for unix users, and there is a zip for DOS users.

>Besides, I hope to avoid all that by just transferring directly all my
>atari stuff to my mac. I have a seller for an 850, now I just need to
>work on getting the right cable from the 850 to a mac, before I actually
>buy it from him.

Ahh, a mac user. I don't know if mac has a CLI, because dcm2atr works
via a CLI. (I suspect it does, even Windows has a CLIsh interface,
you know the one where you click File, Run, and then you can enter a
filename and parameters) But if you do compile it for a Mac, and it
works, uuencode the binary and send it to me, I will put it on my ftp
site. And of course how to execute it, would be nice. If necessary,
I can add code to ask for CLI parameters, it will probably just come
up and say "CLI: " and you have to enter the commands, like -q
test.dcm test2.atr, just like you would via unix or dos. Oh well,
enough of my endless blabbering.

I wish I could help you out some more, but I don't have a Mac, and
probably never will. I fear a new platform. (Isn't UNIX, DOS,
Windows, Atari, Apple, Commodore, and CP/M enough?)

Nope, it's a problem in the INDUS GT and ICD knew about it but
blamed the INDUS. This was way back when SDX was first released, ver
4.18. BTW, 'CAR:INDUS.SYS' should restore the high speed mode. Or is
it just 'INDUS.SYS'.
Oh, yeah, ICD claimed that if you ran it in an INDUS only
configuration that everything worked fine. I don't know as I always ran with
some kind of Atari Disk in the string.

Rich Mier

From: lamcw@aston.ac.uk
Message-ID: <DE6Ktv.JE3@aston.ac.uk>
Source record: 88849

```
;>You don't need DISK IMAGES to use EITHER Rainbow or XFormer.. you can
;>simply access raw files from either of them.
;>
;But you need to have a registered Rainbow for this, correct?
```

Yes, the shareware version has the IMPORT/EXPORT features enabled. These allow you to paste in raw files into a DOS image and then run the game (or whatever) using a suitable loader.

```
;>There are of course bootable disk images for Ataris out there (how else
;>would bootable game disks and DOSes and the like be transferred?).
;>These are DCM images. Either use DCM2ATR (PC or Unix) or DCM2DISK (PC)
;>or DiskCommunicator 3.2 (Atari).
;>
;This doesn't do me much good, if I don't have a PC or a UNIX machine.
```

If you have a DCM disk image you can decode it by running DISCOMM3 under emulation with Rainbow. However, the DCM file needs to be imported into a DOS image before DISCOMM3 can do its stuff...

Chris Lam.

2428. Re: Rainbow an M.U.L.E. HELP!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-08-31 00:00:00 UTC
From: lamcw@aston.ac.uk
Message-ID: <DE6L3n.JnJ@aston.ac.uk>
Source record: 88850

;I got the demo version of Rainbow and the 800 OS. It runs all the demo
;stuff and I got it to run Donkey Kong, but it won't run anything else.
;It either just shows a black screen as with Jumpman, or shows a title
;screen and then crashes as with Ms Pac Man.

Strange! I can assure you that Rainbow can run JumpMan and Ms PacMan fine.

Are you using the 400/800 OS revision B? A is the older one and is the
version which is in my old 400.

Make sure you are in 256 colours.

;What I really want it for is to run M.U.L.E. which the demo version
;should run. I have a disk XFD image of MULE, but it won't accept it. It
;says it is only supported in the shareware version.

Could be because it's an enhanced disk image (133120 bytes). The demo won't
handle these (sorry...)

;But I have no way of getting the image to
;my mac. Could somebody please mail me a UU encoded disk image that
;Rainbow will be able to read? I would like to see how mule runs before
;getting the full program of Rainbow.

Take a peek at ftp.xmission.com in usr/jeking

If you continue to have probs, email me.

Good luck,

Chris Lam.

2429. Re: MULE

;But in the meantime, what is the best way to get the entire M.U.L.E. disk
;over to the Mac?
;Or any game disk, for that matter? I have an 810 with The Chip (tm) in it,
;will that help?

The shareware Rainbow comes with software (called TinyTerm) with which you
can transfer files to and fro from your Mac and Atari 8bit. You can zap
a whole single density image over to the Mac in 3 minutes and an enhanced
one in about 5.

You will need a 850 unit and a few strands of electrical wire for a makeshift
cable.

Chris Lam.

2430. Re: More A8 & pc format single density

Newsgroup: comp.sys.atari.8bit

Most PC disk controllers can't read or write single density. It's
possible that when you formatted a "single" density disk on the PC, you
created something that looks like enhanced density to the Atari drive; it
doesn't go to the next track because it's looking for sectors 19-26. Try
running a sector editor and looking for sector 27.

YES...I am working on the same problem too. Finding an 850 seems like a
long undertaking, software which will work on the Atari side is a problem
too. Bill Mutch...ozwizard.

Welcome to:

THE UNOFFICIAL ATARI 8-BIT NEW USER, EMULATOR HELP FAQ

Revision 0.95, August 29, 1995

By Bill Kendrick

------------------------------------------------------------------

[ Differences from Rev.0.9: Fixed newdex-friendliness; had to do with
less-than and greater-than character hanging around loose! ]
[ Differences from Rev.0.8: Added the missing list ending tags and
some active links (still trying to make it newdex-friendly! [frown!] ]
[ Differences from Rev.0.7: (Weakly) Converted to HTML! ]

------------------------------------------------------------------

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
[ not done ]
Finally, you can always ask Michael for a copy at
mcurrent@carleton.edu
------------------------------------------------------------------

Summary of Atari 8-bit's and emulated 8-bit Atari's:

* Real Ataris: Atari 8-bit computers were produced between 1979 and
1987. The major models released were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when
made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends
when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS, GTIA graphics (Had Missile
Command)
All of the XL's except the 1200XL had BASIC installed on ROM. BASIC
can be purchased on cartridge for the 400/800/1200XL's.
* Emulated Ataris:
+ On IBM PCs/compatibles:
o PC Xformer 2.0 and 2.5x. 2.0 is limited and supports
only 800 OS. Both public domain (were always PD).
```

o PC Xformer 3.0x. Supports all OSes, 320K RAM,
player/missile collision detection (which MANY games
use!)
+ On Apple Macintoshes:
o Rainbow
+ On Atari STs, TTs, and Falcons:
o ST Xformer 2.0 and 2.5 released for the Atari ST 16-bit
machines. Very limited. Now public domain (used to be
commercial).

Capabilities of an Atari 8-bit:

GRAPHICS:
* The Atari has maximum resolution of 320 x 192 (standard,
non-overscanned screen) x 2 colors. 160 x 192 x 4, 160 x 192 x 2,
160 x 96 x 4, 160 x 96 x 2, 80 x 48 x 4, 80 x 48 x 2, 40 x 48 x 4
graphics are also supported. 40 x 24 x 256-character (128 normal,
128 inverse, character set indirection available) text mode is
standard (2 colors).
* 40 x 24 x 128-multi-colored-character (4 colors per character
allowed, the other 128 characters have 4th changed into a color 5)
and 40 x 12 x 128-multi-colored-character screen modes are
available.
* GTIA graphics support 80 x 192 x 16 shade-only, 80 x 192 x 16
hue-only, and 80 x 192 x 9 color screen modes.
* Normal (bordered), narrow (underscanned), and wide (overscanned)
screen modes are available.
* Screen modes can be mixed (by lines) down the screen using the
Display List (a program which is executed by the ANTIC graphics
chip every screen refresh (60 times per second on real NTSC
Ataris).
* Fine scrolling (both vertical and horizontal) can be enabled on
any line on the screen.
* All other screen attributes (color, player/missile horizontal
position, screen width, player/missile/playfield priority, etc.)
can be ajusted at any point down the screen via a "Display List
Interrupt."
* Four 8-bit wide, 128 or 256 byte high single color players, and
four 2-bit wide, 128 or 256 byte high single color missiles are
available. A mode to combine the 4 missiles into a 5th 8-bit wide
player is also available, as is a mode to XOR colors or blacken
out colors when players overlap (good for making three colors out
of two players!) Players and missiles have adjustable priority and
collision detection (which is not supported by the PC Xformer 2.0
and 2.5 and ST Xformer programs).

SOUND:
* Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3

and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.
* A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.
* Some hardware stereo upgrades (like "Gumby") exist which double the number of voices.

Objective of this file:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten, well, fed up with the XF2-based questions which did not pertain to them, or to the really dumb questions which were in fact understandable to new or rusty Atari 8-bit users, but had just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference (and got me the job of writing the commerical 3.0 release's documents!).

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits [grin]).

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Since revision 0.4 of this file, PC Xformer 2.5, a replacement for 2.0, and 3.0, the first commercial release, have been released. It is assumed that the reader has the latest versions of PC Xformer (2.5 or 3.0), although if you have 3.0, I must say, those documents are great! (If you don't get the joke, look at the name of the author of the manual, and look at my name.)

Since revision 0.7 of this file, Rainbow, an Atari 8-bit emulator for Macintoshes, and "6502", an Atari 8-bit emulator for Unix, have been released, and a 4.0 version of PC Xformer has been announced (and will require Windows 95).

-- QUESTIONS AND ANSWERS: --

1. What does "READY" mean?

This is the Atari BASIC prompt. See below for hints on Atari BASIC.
2. Why doesn't this program load?

The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System. Be sure you're in 800XL or 130XE mode. (130XE mode is only supported by XF3.0, not 2.5, but there is no real difference in the operating systems.)

It may not work under the XL/XE Operating System (rare cases), switch to 800 mode.

Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.

It might be a BASIC game! Be sure you're in BASIC and use the BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it works with the BASIC you have. Some programs only run in BASIC XL or XE (which are both cartridge-based BASIC's not currently supported by the Xformer), and some run with TurboBASIC XL (disk-based).

It may just refuse to run on the emulator.
3. How do I turn off BASIC?

To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).
4. Why doesn't this game/program run correctly?

It may use player/missle collision detection which is not supported on the XF2.5. You might have to shell out the $29.95 for 3.0!

See "Why doesn't this program load?", above.
5. How do I exit XF and return to DOS?

Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.
6. How do I get to Atari DOS?

In BASIC, type "DOS" at the "READY" prompt.

Reboot without BASIC on.

Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XFORMER" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF25.ZIP file or on your XF3 disk).
7. How do I use MSDOS files with XFormer?

Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image). Example: XFORMER MYDOS45.ATR filename.ext

When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XFormer which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XFORMER from.

Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XFormer. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

If you can, use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface. (Unfortunately, this doesn't run on all IBM's!)
8. Just what ARE .ATR and .XFD files?

Refer to the XFormer and SIO2PC manuals for details on these files.

Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XFormer (and the S2PC program mentioned above). .XFD files are used by ST Xformer (the Atari 8-bit emulator for Atari ST's) and PC Xformer (XF2,XF25,XF3).
9. What's SIO2PC?

Refer to the XFormer and SIO2PC manuals for details on this program.

This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XFormer does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced Atari 8-bit users).
* AtariDOS and MyDOS QuickReference: MyDOS (4.50 and 4.53) presents the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in MSDOS)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to "dir i:*.*")
+ [A] Disk directory (like "dir " and optional output destination)
+ [B] Quit to cartridge
+ [C] Copy file(s) ("[source],[destination]" copies from one place or disk to another, just "[source]" copies from one place on one disk in a drive to the same place on another disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted first) (add ">*.*" or ":*.*" after a subdirectory name to delete the files within it. A subdirectory name alone will delete the subdirectory (if it is empty and unlocked)). (Acts like both "del" and "rd" in MSDOS.)
+ [E] Rename file(s) (renaming multiple files is allowed, but be careful). (like "ren [old] [new]" in MSDOS - with MyDOS, use "," between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending (like "attrib +r [mask]" in MSDOS.)
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which boots with the current version of MyDOS you are using and also has the menu file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
+ [I] Formats a disk (add "/N" after the drive number to do a quick-format of an already-formatted disk (ie, just a very fast "delete `*.*'").
+ [J] Duplicate disk (copies an entire disk, including boot sector, when using XFormer, it's much quicker to just copy one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like "[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is "E477", reset is "E474" (these are the hex values of the addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC, for example) it will write what is in memory to a file "MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost forever. When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV is reloaded and the environment should be as it was when you left. It's probably quicker to simply "SAVE"

your programs (if in a language) which aren't nearly as big as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly for advanced users or special setups. See the MyDOS docs for details.
+ [P] Set density. Forces a drive to be recognized at a certain density if MyDOS can't figure it out. (??)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS) This makes "D:" now the same as a subdirectory or other drive. ie, "D2:" will make all calls to "D:" act as though they are to "D2:" instead. Some programs when prompting for filenames do not add "D:" to the beginning if one is not present, they add "D1:". If you don't trust a program to look to "D:" instead of "D1:" and you want it to look to some place OTHER than "D1:" (ie, where "D:" is pointing which could be a VERY long path list), just add "D:" to the beginning. ALSO, some programs don't even ADD "D:"'s if they aren't in the filenames you give and may give errors (138, for example: device not present, ie, if you said "TESTFILE.DAT" it may think you want "T:" instead of "D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify is on, writes will be slower but 100% reliable. With it off, writes will be much faster but possibly not as reliable (on bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:
+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)
* General DOS and OS questions:
1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk,

you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!

After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?

Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?

Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the

"root", and all of the "Folders" within it have more windows in them which also have file and folder icons.

Here's a comparison to using subdirectories on different DOSes

root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\

Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?

As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames.
o D: Disk Drive
Readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS, 8 on AtariDOS).
o E: Editor
Readable, writeable. This is how input from the keyboard and output to the screen is normally handled. If you wish to type a small file up by hand and have it sent to the printer or a file, use "E:" as the source.
o G: Graphics Printer
Writeable. This is not built into the Operating System but must be loaded. This is an Epson-compatible printer driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is not `echoed' back like with the "E:ditor".
o M: "Multi-Mouse"
Readable, writeable? This is not built into the Operating System but must be loaded. This is a handler which runs in the background and accepts input from either a mouse, a joystick or a touch-tablet and displays a mouse pointer on the screen.
o P: Printer
Writeable. Send data to this and it will appear on the printer. You can print files (documents, etc.) by using

"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:
handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?

As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:"

-- Getting around on the Atari: BASIC --

What does "READY" mean?

Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
* Entering a command will cause it to act immediately.
* Entering a line number and then a command will place that line
into the current program.
* Entering a line number alone will remove that line from the
current program.
* To start a program, use the "RUN" command.
* To erase a program, use the "NEW" command.
* To clear variables, strings and arrays, use the "CLR" command.
* To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command
followed by a filename.
* To save a program, use the "SAVE" command followed by a filename.
* To list a program, use the "LIST" command followed by an optional

destination device ("D:file.lst", "P:"rinter) and an option start and end set of lines seperated by (a) comma(s).

Where can I learn Atari BASIC?

A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of August 1, 1995, these particular files do not exist).

How do I quit BASIC?
* Type "DOS" to quit BASIC and return to DOS.
* Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
* For XFormer users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Why don't strings work?

Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0 and 10 characters.

How do I make graphics?

Use the "GRAPHICS" command to switch between the following screen modes: (Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))

(Note: Add "32" to the mode number to keep the screen from clearing when it appears. One problem, however, all screens overlay each other so unless you only use certain modes at certain times, parts of some screens will become (or start out) with 'garbage' on them.)
* 0: 40 x 24 x 2 text
* 1: 20 x 24 x 5 text
* 2: 20 x 12 x 5 text
* 3: 40 x 24 x 4 graphics
* 4: 80 x 48 x 2 graphics
* 5: 80 x 48 x 4 graphics
* 6: 160 x 96 x 2 graphics
* 7: 160 x 96 x 4 graphics
* 8: 320 x 192 x 4 graphics
* 9: 80 x 192 x 16 luminence-only graphics
* 10: 80 x 192 x 9 graphics
* 11: 80 x 192 x 16 hue-only graphics
* 12: 40 x 24 x 4-colored text
* 13: 40 x 12 x 4-colored text

* 14: 160 x 192 x 2 graphics
* 15: 160 x 192 x 4 graphics

COMMANDS:

Commands available in Atari BASIC for manipulating simple graphics include:
* PLOT x,y - plot a pixel
* POSITION x,y - position cursor
* COLOR c - set drawing color (c=color or character value)
* DRAWTO x,y - draw a line from cursor location (set with "POSITION", "PLOT", "DRAWTO" or "LOCATE")
* LOCATE x,y,r (where r is where result will be stored)
* SETCOLOR c,h,l (c=palette location, h=hue, l=lum)

COLORS:

Note: COLOR command colors are not identical to SETCOLOR command colors:
* COLOR 0 will draw using the background color, set with SETCOLOR 4,hue,lum
* COLOR 1 will draw using color "0", set with SETCOLOR 0,hue,lum
* COLOR 2 will draw using color "1", set with SETCOLOR 1,hue,lum
* COLOR 3 will draw using color "2", set with SETCOLOR 2,hue,lum

Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be POKEd into memory locations 704, 705, 706 and 707 (the player/missle graphics color locations). Examples of this will be presented in the BASIC usage files. (Sorry)

How do I make sound on the Atari

Remember, XFormer 2.5 doesn't support sound! (XF3.0 does)
But anyway, in Atari BASIC: SOUND c,p,d,v
* c=channel (0-3)
* p=pitch (0-255)
* d=distortion (0,2,4,6,8,10,12 or 14)
* v=volume (0-15)

The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

How do I move the cursor and edit?

The Atari "E:" device (standard input/output which is the "editor") allows the following characters for editing:

Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)

Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)

Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! [grin])

How do I make the editor characters appear

As shown above, you must have an ESC sent before them.
* When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
* When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear.
When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where

the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!

Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

What's with the colors changing?

THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
* To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).
* To turn it on, wait 7 or 9 minutes without pressing a key or having location "77" set to "0", or set location "77" to "128" with "POKE 77,128", voila! instant attract mode!

How do I access 'devices' on the Atari?

The following commands are available to Atari BASIC's (and also variations on these are available in most other Atari languages!):
* OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with auxillary mode 'c'. Channel 'a' must be free or else a 'Channel already open' (129) error will occur. To explain the different "modes", here are simply some examples:
+ OPEN #1,4,0,"K:"
Input from keyboard
+ OPEN #2,8,0,"P:"
Output to printer
+ OPEN #3,12,0,"D:FILE"
Random access to disk
+ OPEN #4,9,0,"D:DATA"
Append-output to disk
+ OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
+ OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT" mask)
* CLOSE #a
Closes channel 'a' (freeing it for use)
* GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
* PUT #a,b
Puts byte 'b' onto channel 'a'

* INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
* INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores the numeric value of
it in 'b'
* PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed types are
of course allowed).
* STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
* XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be expanded
upon in a future revision. Just be aware of the following:
+ a - command
+ b - channel to use (usually must be free)
+ c - auxillary mode 1
+ d - auxillary mode 2
+ e$ - file or device to act upon
Examples:
+ XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
+ XIO 33,#1,0,0,"D:OLDFILE" deletes file
+ XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
+ XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write and
deletion
+ XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
+ XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file (like
"L" in Atari and MyDOS)
+ XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L" in
Atari and MyDOS with the "/N" option)
+ XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
+ XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use:
+ XIO 253,#[channel],1,0,"D[drive]:" for formatting a drive in
enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the "XIO
40" example.

-- Getting Atari files to an IBM: --

1. How can I read Atari disks on my IBM?

Note: Someone please give more details or corrections here!
Thanks!

If you have double-density Atari disks, you can use the program "Util" on the IBM which can read double-density Atari disks. Please see the Atari 8-bit FAQ for more details.

If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.

If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.
2. Ok, I can't do any of that, now what?

You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!

You can use two modems (one on your PC and one on your Atari) to download files from your Atari 8-bit.

If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.

If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.
3. Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images or PC Xformer XFD disk images other than using Disk Communicator 3.2 on my Atari! I mean, both files are disk images! They're both on my PC's hard drive!

[cry]

(AND NOTE: DiskComm. doesn't like SIO2PC a lot of the time
anyway!)

Yes! There's an IBM program out called "DCM2DSK". (Why "DSK" and
not "ATR"? To keep people from getting confused with the
ATR-8000(?))

There's also C source to a very similar program called "DCMTOATR"
which works on PC's (a PC executable version comes in the archive)
and Unix and probably any other system with a good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

+ PC Xformer 2.0 and 2.5 can be downloaded via FTP from:
o "ftp.clark.net":
Directory/file-path: systems/msdos/emulators/xf25.zip
(or xf2.zip)

Are these files really at the Archive? Not on my mirror yet...
I am this $@#*&% who sent these files to Jody Lenn (it was about half a
year ago). I've packed them in this way only for e-mail transferring. I've
asked Jody Lenn to gunzip and untar them before placing on the Archive.
I didn't think that he forget it (Inside the tar file some files are
compressed again with .Z, only that ones I planned to place in that form)!

Moreover, not all files are destined to the Demos directory. There are
game and two archivers (one as the ARC file) in other.tar.gz archive file.

I'm very sorry for this incident. I'll try to fix it with Jody's help.
I'm also content with ARC (ALF) files. :-)
Well, sometimes I choose LZH...

B.

I thought the file header was different on cassette versus disk, at least with ML programs that load and run.

Most of those programs that I've seen have an option to write to disk
or cassette -- at least the ones in ANALOG did.

If it's not built into the program, you might be able to just replace
any references to "C:" with "D:FILENAME.EXT" (using your favorite
filename, of course).

2443. Re: ***Indus GT disk drive***

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-01 00:00:00 UTC
From: Jason Hedrick <102416.675@CompuServe.COM>
Message-ID: <427ueg$a4l$1@mhadf.production.compuserve.com>
Source record: 88766

Rich,
Okay. I already tried reloading INDUS.SYS from the cart. It the problem
in the drive?? BTW, the INDUS GT would be drive C, while a 1050 Super Archiver
drive and an XF551 are drives A and B, respectively. Could this cause a problem?
I know I may sound a bit naive, but I know nothing about the Indus GT.

-Atari 5200, 4 port, manual, switchbox and joysticks, no power supply
$46.50
gmofley

-Atari 800XL w/ power supply $15.00 luis

-Atari Keyboard Controller

Send all bids to: jrm8248@u.cc.utah.edu

TRADES:

The only things that I will be willing to trade for are Sega Saturn Items.

HERE ARE THE RULES:

1. This auction will end on Sunday, September 3, 1995 at
Midnight Mountain Time.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless otherwise specified.

4. When sending a bid, your subject must be ATARI BID .

5. Minimum bids will be $1 and bidding increments will be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50 for each additional cartridge. Shipping and handling for systems will range between $6 and $10.00 depending on weight. Larger systems may be more. All cartridges and systems will be shipped through the US Postal System anywhere in the Continental US. Other areas will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted individually for payment and shipping. Money Orders (sorry no personal checks) are the preferred form of payment, but cash is always accepted. Payment MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased from this auction. Cartridges have been tested and do work, unless otherwise specified. Mo systems have been tested and do work. The systems which may not work are the ones without cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER WILL BE INFORMED AND YOU WILL BE BARRED FROM FUTURE AUCTIONS!!!

Your participation in this auction signifies your consent to follow these rules as stated.

2445. BASIC file which writes an assy lang game

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-01 00:00:00 UTC
From: sharris@bobcat.ent.ohiou.edu
Message-ID: <DE8svq.344@boss.cs.ohiou.edu>
Source record: 88768

I've got about 4 basic files from a friend who must've gotten
them from a magazine way back in the hay-day of Atari 800's,etc.
They write boot games to cassette. Now I have a Disk drive
and I was wondering how I change the programs to write the boot
games to disk instead of cassette. Any help would be appreciated.

Maybe there just isn't something new every week.

Then again, I'm waiting to see the "Weekly posting..." showing my
re-uploads of Tomasz's files. Last I checked they were still in the
New directory.

I use the actual ARC.EXE program, so I can use almost the same
commands on the PC as in SDX. (When ARCing on the PC, you have to be
sure not to use "version 6 format", or else the Atari programs can't
unarc it.)
It should be available at the big ms-dos archives, such as
oak.oakland.edu, or even msdos.archive.umich.edu.

I was going to continue on but it struck me as funny. I see from your tag
you are from either Austrailia or Austria, no?

The message you originally read originated from the USA where we have a
rather odd (as compared to most of the rest of the world) dating
structure:

USA: MM/DD/YY Perfectly standard to us Americans but probably a bit
different to you.

Just one more thing to be aware when you cruise the infobahn.

updated 08/31/95

I have the following 8-bit computer equipment for sale or trade. The list includes systems from Atari, Commodore, Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping costs, which will be sent via U.S. Snail. The shipping cost depends on both the weight of the package and the distance that it is traveling. Buyer has the choice of either first class or parcel post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Canadian buyers must send a Canadian Postal Money Order, payable in U.S. funds. This is the only way I have found to deal with my friends to the north (my bank is very picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

* = (after price) Tentatively sold/traded. Inquiries welcome.

I made a scematics drawing on the sio2 interface (2 chip), and build
it after that one, and it works, unfourtunaly I did it in MS Pub
(finding out not much of export possibilitys).
I am trying to get it out in a more readable format, but if some one
want�s it now, I can fax it or mail the sio.pub file or a save from
the postscript driver in win wg 3.11 , as sio.eps
I also noticed when trying the interface out with the sio soft and
ape, that one had to fiddle around with timeings, felt rather dead
unitl timeings where right.

Source record: 88775

Well, its me again. Thank you to those that have replied to me already, but unfortunately I am still having problems getting the PC and Atari to talk to one another. I took the suggestion of wiring IC Pin 8 to the ground, and it seems to have helped. Here is my setup first:

Atari 800XL w/256K Newell RAM, SpartDOS 3.2d, US Doubled 1050.

IBM (clone) 80386dx25 w/4mb, IDE, ISA Bus, 16450 Serial Card (I think), an Internal High Speed modem (on a different interrupt), AMI Bios, and about 8 feet of cable hooking it to the SIO2PC box. I'm using version 3.19 of the SIO2PC software, and IBM DOS 7.0

When I boot the software up on the PC, and set the 'T'oggle Command Line control option under 'A'lter Timing, once. Then I load a couple of disks (1, 2, 3). The Atari is booted off the 1050 with SpartDOS and I try to read a directory of D2: (should be on the PC). The Atari times out with a 138 error.

On the PC, the Stat line reads:

LOC:I CMND:R LAST:? DEV:32 COM:L ERR:f SEC#: 1 SPD:N
when the Atari is trying to access it, the LOC: I flashes to "LOC:B" and the ERR changes from "f" to "q". Things revert back to the above line after the Atari times out.

My timing values are currently left unmodified, at T1:0300,T2:0FA0
T3-T5:0300,T6-8:0000

Can anyone help me with this particular situation?
Again, sorry to bother the rest with this...

Okay, I ftp to amiga.archive.umich.edu and the Atari section is gone.
Zip, zilch, nothing. There's still IBM, Apple, and the others, but no
Atari at all. Is this just with amiga.archive or is it gone from the
others? (i.e., atari.archive.umich.edu, archive.umich.edu, etc.)
There's no notice either. Anyone have any input on this?

I would try those other ftp addresses, but you know how it goes...
"Too many users... Too many users... Too many users" (I'm starting think
it's all a scam since have have NEVER been able to connect to those.)

Hello back atcha! Yes, get a copy of PKUNPAK from PK Ware (shareware,
don't forget to pay the fee). It does a fine job of unARCing any ARCed
files. You can find it in the SIMTEL archives and its many, many
mirrors. (PC file)

DON'T TOGGLE! If you do, make sure your LOC: should be G when nothing is going on, D when the Atari drops the CMD line low to request data. Other then that, it sounds like you're going to have a fine set up. I can't recall the reason for the toggle, it's buried in the docs somewhere, but it was added as a way to lock out the Atari.

: There's no notice either. Anyone have any input on this?

Okay, I gophered to the umich archives and all is well. But Atari is
still not at amiga.archive.umich.edu. Maybe they thought we were using
it too much, too easy to connect with them. An archive called
amiga.archive.umich.edu without Amiga files. What a concept!

Well, I couldn't get into atari or msdos, but at amiga I got "atari:
Connection timed out." when I tried to cd to the atari directory,
which tells me that there's just something wrong with the connection
between the amiga machine and the rest.
If the directory were completely gone, we'd get a "No such file or
directory" error instead.

I was able to find the atari archive using gopher and WWW:
gopher://gopher.archive.merit.edu:7055/11/atari/8bit
http://www.umich.edu/~archive/atari/8bit/

2460. Rick C.'s 'mule'

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-02 00:00:00 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1995Sep02.163209.18647@wariat.UUCP>
Source record: 88782

(What's going on, umich dropped A8? A bunch of messages are re-posts?)
Well, I guess Rick C. can come and kill my dog, because I'm
pretty sure he won't like this message. (I've got six dogs
and 8 cats, wonder which one he'll pick?)
So, I tried Rick's 'mule'. The .com file went back to the
SpartaDOS 'D1:' prompt on my A8. The .exe file locked up my
pc. The mule.act file was in a ascii format I never saw,
with 13,13,10 cr/lf. That took more than my asc2atas to
fix. The mule.c was in standard atascii. So, after some
translating of cr/lf, I got mule.act to compile on my A8 ok
and run ok. The 'mule.exe' by itself in the umich archive
made all sorts of little colored characters appear on my pc
screen and made me a little nervous. I can't test mule out
because I can't run mule.exe. My C compiler doesn't know
about Rick's #include string.h and io.h. I guess io.h is
farily fancy, I dunno. Anyhow, I couldn't recompile mule.c.
So, Rick's document said somebody else had to upload 'mule'
to umich. I think the Atari Archive project did, (somebody
from Louisiana.)
If Rick wants to, he could upload a new 'mule.arc' to
umich. That would be nice.
(Or somebody could e-mail me one that works for them.)

Russ; Silly question maybe, but you didn't leave the Atari .COM file in the same directory as the MS DOS .EXE did you? That seemed to be the #1 problem people had. Other then that, everything but the actual command files started off as text files. I have a tendancy to program that way i.e. Put(125) vs the clear screen arrow. Ditto for the C source on the IBM side, shouldn't be nothing but ASCII in there. If you got anything else in the readable files, something other then straight ATASC for the Action! source code or ASCI for the Turbo C source, them files is busted! I'll take a look & see if I can file some of the original files, I seldom use the wacky thing myself<g>. I'll see if I can get an .UUE file to you this weekend.

Source record: 88789

mbrown@fn1.freenet.edmonton.ab.ca wrote:
: Well, its me again. Thank you to those that have replied to me already,
: but unfortunately I am still having problems getting the PC and Atari to
: talk to one another. I took the suggestion of wiring IC Pin 8 to the
: ground, and it seems to have helped. Here is my setup first:
:
: Atari 800XL w/256K Newell RAM, SpartDOS 3.2d, US Doubled 1050.

May seem basic, but make sure you dont have your 1050 set to any
drive # that you assign to SIO2PC (err, APE :)

: IBM (clone) 80386dx25 w/4mb, IDE, ISA Bus, 16450 Serial Card (I think),
: an Internal High Speed modem (on a different interrupt), AMI Bios, and
: about 8 feet of cable hooking it to the SIO2PC box. I'm using version
: 3.19 of the SIO2PC software, and IBM DOS 7.0

: When I boot the software up on the PC, and set the 'T'oggle Command Line
: control option under 'A'lter Timing, once. Then I load a couple of disks
: (1, 2, 3). The Atari is booted off the 1050 with SpartDOS and I try to
: read a directory of D2: (should be on the PC). The Atari times out with a
: 138 error.

: On the PC, the Stat line reads:

: LOC:I CMND:R LAST:? DEV:32 COM:L ERR:f SEC#: 1 SPD:N
: when the Atari is trying to access it, the LOC: I flashes to "LOC:B" and
: the ERR changes from "f" to "q". Things revert back to the above line
: after the Atari times out.

Dev 32 is drive #2, it should say Dev 31 as you boot unless SIO2PC is
changing the sio device # before showing it.

LOC:B is some debugging info about what SIO2PC subroutine you are in. Its
for debugging, but does not seem too helpful to me :)

: My timing values are currently left unmodified, at T1:0300,T2:0FA0
: T3-T5:0300,T6-8:0000

: Can anyone help me with this particular situation?
: Again, sorry to bother the rest with this...

When you turn on the ATARI, the COM: should first go to 'H' then start
toggling back and forth as the ATARI raises and lowers the COMMAND line.

If this never changes the command->ri line on your SIO2PC cable is not
wired correctly, or the UART on your PC is not returning an interrupt
for RI.

Help this helps you.

: 0000 sectors free. If I create a DD disk through my 800 and try to view it
: under xf3.0a, it tells me there are 0000 secotrs free. I can view these disks
: under the 'computer' they were created on(ie, ones created under xf3.0a work
: fine)

: Any help appreciated

Once you create the 'disks' they are just like floppies you bring
home from the store, TOTALLY blank. You need to FORMAT them with your
favorite DOS to lay down the boot sectors, directory and VTOC.

When spartados choose XINIT (for floppy sized images) or HDINIT for very
large images.

: Also,
: I have alot of originial software I would like to run under xf, but there is
: copy protection on the disks. Is there something I can buy that will
: 'unprotect' these? Specifically, Id like to get my Ultima disks converted
: (II, III, IV)

I think someone i still selling copies of Chipmunk, which unprotects
some software.

It IS possible to emulate some copy protection schemes. I have made some
mods to APE to allow 'error lists' for images, but its only effective
on the simplest forms of copy protection such as CRC errors. I was
able to boot Apple Bandits using it, and alternate reality, but it takes
a while to create the protection list since you have to do it by
hand at the moment.

My argument has always been, and still is that it is FAR FAR easier to
unprotect the games than it is to emulate the copy protection.

(and now i know :)

: With a hard drive setup it is too easy to forget. But what about the
: atr? They would mostly be used on a PC, and a program to create a
: "double sided" .atr from two .dcm files could be written. That should
: be the easy part compared to deciding on file format etc. Is there
: even interest?

Its quite possible to make double sided ATR images, but you would most likely
be able to read them only with APE. You could also 'auto-flip' define
a sector to 'auto-flip' the disk at.

For example, ENCHANTER. Lets say the last sector Enchanter loads before it
asks you to flip the disk is 600 (just guessing), you could tell APE to
automatically flip the disk image after that sector is read.

In any case, if there is enough interest I could add it.

Source record: 88793

Russ Gilbert (Russ.Gilbert@apk.wariat.org) wrote:
: Marek Tomcyk has been most helpful in information about
: sector 'skew's or sector ordering for formatting a A8 disk.
: I'm looking for a RELIABLE way to read/write/format single
: density A8 disks on the pc. Altering the sector skew just
: seems to effect the speed at which A8 and pc drives find
: given sectors, due to the timing I guess. Here's my
: question:

: Is there an optimum sector skew and most importantly
: inter-sector gap for formatting disks on the pc? I'm about
: to give up. I've used a box of 25 disks experimenting and
: still haven't gotten reliable reads on either the A8 or pc.
: (Where's R. Dell when you need him?) Any one? Please jump
: in or e-mail me.

Russ,

About the sector skew, i believe all that does is allow the
controller to return sectors faster by making sure the next sector is
under the head when the last sector has finished being sent. The drive
therefore does not have to rotate the disk all the way around to find
the next sector since its already under the head. I assume this just
involves writing a diffrent sector number in the sector number field of
the track, and does not effect the gap, etc.

Im not up on the real physical formatting of disks in a
PC, but here are some specifics from the FD1771 controller specs on
formatting a track:

Number of Bytes Hex Value of Byte Written
---
40 00 or FF
6 00
1 FC (Index Mark)
26 | 00 or FF
6 | 00
1 | FE
1 | (Track Number, 0 - 4C)
1 | 00
1 | (Sector Number 1 - 1A)
1 | 00
1 | F7 (Two CRC's Written)
11 | 00 or FF
6 | 00
1 | FB (Data Address Mark)

128 | Data (IBM Uses E5)
1 | F7 (Two CRC's Written)
27 | 00 or FF
247 ** 00 or FF

Notes: | = Write these fields 26 times
** = Continue writing until FD1771 interrupts out, approx 247 bytes

There is also a nice diagram showing the data/gap layout on the track, please
e-mail me if you need this info.

On the same page:

" NON IBM FORMATS "

" Non IBM Formats are very similar to the IBM formats "
" except a diffrent algorythm is used to ascertain the "
" sector legnth from the sector legnth byte in the ID"
" field. This permits a wide range of sector legnths "
" from 16 to 4096 bytes. Refer to sector V, Type II "
" commands with b flag equal to zero. Note that F7"
" through FE must not appear in the sector legnth byte"
" of the ID field"

" In formatting the FD1771, only two requirments "
" regarding GAP sizes must be met. GAP 2 (i.e. the"
" gap between the ID field and the DATA field) must be 17 "
" bytes of which the last 6 bytes must be zero and that "
" every address mark must be preceded by at least one byte"
" of zeros. However, it is reccomended that every "
" GAP be at least 17 bytes long with 6 bytes of zeros "
" The FD1771 does not require the index address mark "
" (i.e. DATA = FC, CLK = D7) and need not be present"

: I get reliable results double density formatting on the pc
: with the sector skew from C. Marslett's 'util'. I do change
: the inter-sector gap for read/write and format from
: Marslett's 28 and 24 to 14 and 24.
: Now I'm trying to get reliable results in single density.
: Again, the pc will not find the address mark (track) of an
: A8 formatted disk. My best results are formatting single
: density on the pc using the same sector skew and
: inter-sector gaps as for double density. I just change the
: bytes per sector parameter in the disk base table. The pc
: will read the sectors up to 16 reliably. At 16, the pc has
: trouble finding the sector. The Atari will read the first
: 18 sectors, but then doesn't move the read/write head for
: the next track and can't read sector 19. Thanks, Russ

Hope this information helps.

My souped up 130xe in a PC case with BB/FB, transkey, mem upgradde, etc. does this as well, however for me it is convienient as it gives my hard drive a chance to spin up. I did not install the TK freeze or anthing like it either. I get the same ugly green screen until I press reset. When I use the normal power supplies, everything boots as it should. It is odd though. Check your power supply, that seems to make the difference in my system.

The "amiga" port of Umich is a total mess most of the time, but it's usually VERY easy to get into. I had the same problem today, but I have a feeling it's just a temporary glitch (as usual).

Try Gophering to "gopher.archive.umich.edu" Then go: #6-Merit_SW_Archs Then: #4-Atari_Archs Then: #12-8bit and viola, you're there.

Ya can't upload tho.. >:^[

DCM2DSK is a nice DCM->ATR converter (and will do more soon) for PC's (MSDOS).

DCM2ATR is a nice DCM->ATR converter for PC's (MSDOS) which runs fine under Unix.

You can't ask for a "Unix executable" since so many different machines run Unix. If you're on a Unix box w/o a C compiler, that's pretty damned odd!

They're available at Chad Wagner's FTP directory whose site/path I've forgotten. There's a link to all this stuff from my home page, though..

There HAVE been uploads to UMich - all those previously .gz'd things,
for example.

Well, now there's an Ape directory with Ape in it, but have you looked
in the "Newitems" directory?

ALL of this new stuff is NOT in there (when a new file comes in and gets
validated, it gets moved to an appropriate (usually) directory, and a LINK
is made to it under "Newitems"..)

It's been the SAME 29 files for MONTHS! Hell, "F.R.E.E." is still in there!
It was uploaded before summer, wasn't it? But when was "Ape" uploaded?
Within the past week.

Why is "F.R.E.E." still in "Newitems" and "Ape" is not... !?!??!!

I think I'm sticking to James Kings FTP site for now until UMich starts
acting normally! <:^[

I used to run an Indus and a doubled 1050 together with SDX and the
INDUS.SYS driver, and I don't remember having any problems.

It's been a while, so I'm afraid I can't be much help with the
details.

>fault, it probably is mine. What am I doing wrong?

I don't know anything about the PRO boards, but I do know about
modems. With 14.4k and 28.8k modems, the modem-to-modem speed can be
no higher than 14.4k or 28.8k, as you'd expect.

However, these modems use data compression, so the modem-to-computer
speed can be up to 4 times higher than the modem-to-modem speed. This
is especially noticable with text, which can be compressed a lot.

Your software and modem interface should be able to handle hardware
handshaking for this to work correctly, though. I'm a little
surprised it's working with Bobterm; I didn't know it could do
hardware handshaking.

>
>-bill!

The original purpose of this is to take care of directory listings
that are twice as long as they should be. I thought two files for
every 1 flippy disk is a waste and a step backwards. It is not a
matter of "laziness" as you put it. I see your point in using the
macro keys to go into the file menu and select the other side to a
disk, but I have 40+ Antic disks alone that I would like to convert,
and there are not that many macros, even in the registered version
(which I plan to get, as soon as Steve sends me 1.05). In addition,
if one were to have side 'a' of a disk loaded into drive bay 1, and
side 2 in bay 2, etc., one would have used all 8 drive spaces for 4
flippies. Granted we may not need all this power, but one can never
have too much incorporated into a program, (especially for $40!!).
Don't get me wrong, the program is _definitely_ worth it, as is.

>For example, ENCHANTER. Lets say the last sector Enchanter loads before it
> asks you to flip the disk is 600 (just guessing), you could tell APE to
> automatically flip the disk image after that sector is read.

This could cause problems; if you implement this, also put in a way to
turn "auto flip" off. If I went in with a sector editor and wanted to
edit sector 600, I wouldn't want to read side one's sector 600, and
then write to side 2's sector 600, because APE "auto flipped" after it
read sector 600. The Auto flip might be more trouble than it is
worth. Now we are approaching "lazy". (Isn't that the point of
having computers though? to simplify our lives?)

Anyway, I digress, I just thought it was a neat idea worth looking
into.

>Also, if you become a programmer, I suggest MAE, Action! and TurboBASIC XL.
>:)
Thanks!!

Rick Ziegler

BTW, I thought your "X12" was F12, so I assumed you were talking about macros, not SIO2PC. Sorry. I still addressed your concern though.

2482. Post ARC.EXE please

Mathy; .02, you may want to check with a VOM to make sure the grounding
& wall sockets are wired right. I'm not sure if you have the little
three light tester like we have in the US, but they can REALLY save you
some grief. Kendick seems to have a similar problem & I can recall at
work we had one piece of equipment that would give you a visious shock
if you so much as touched a metal part of it. It was traced to the
the ground/line/hot wires of the strip socket being wired wrong.
I'm looking at the 800xl schematics as I write this & for the life
of me, I can't see anything but capacitors in the pokey audio output.
What this means, if you happen to something in that has a high potiential,
from static or improper ground wire, you'll get a HUGE spike into pokey.
A safer way to have done this would have been to add a zener or a couple
of diodes in series somewhere on the AUD out to prevent this from happening.
I won't call it a design flaw, but it's obvious the Atari engineers didn't
plan for this type of occurance.
Rick

Cleaning out the closet, I found a number of thigns I'd like to get rid of.
Please make an offer for the whole lot, as well as the individual piece.

Hardware:
Atari 1200XL, manual, power supply, rf box, cables,
couple of books,

Atari 65XE, manual, rf box, cables, no power supply

Atari DOS XE XF551 5.25" Floppy, manual, power supply

Software: MegaFiler Database, boxed
Springboard Newsroom, boxed

Everything is in really nice shape, I just can't seem to locate that dumb power
supply for the 65XE. Please, make an offer for everything that I can't refuse!
My terms are COD or pre-pay, and I can provide references if necessary.

Mail me for more info. Thanks!

DCM2ATR was originally written for DOS, the DOS executable and source
code is available, freely, from my ftp site.

>Also, should I be able to use a Unix machine at work, where can I find
>DCM2ATR executable (not source) for Unix please?

ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr12.zip

The PC-DOS/MS-DOS executable is in that archive, as well as C source,
if you wish to compile a UNIX version. The UNIX version is primarily
for users who use the Atari emulator for UNIX, and those who have
access to a UNIX machine, (but not a DOS machine), and wish to use ATR
or XFD images for a different platform which is not supported.

DCM2ATR currently will compile under Borland Turbo C++ for DOS, and it
is known to compile under AIX 3.2.x, FreeBSD 2.0.5, Ultrix, and
several other platforms.

I was planning on a reverse converter, ATR2DCM, but I haven't had a
chance to actually work on that project.

Most DCM files are disk images, they have their own boot sectors, and
are often not conforming to a known DOS directory structure. Try
using the created images as D1:, i.e. XF252 disk.atr, if disk.atr was
the converted .dcm file.

2487. A Matter of Choice

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-03 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <JBOAsdY.ransom22@delphi.com>
Source record: 88721

I did it. I just gave my MS-DOS box to a soon-to-be in-law. I am
now an Atari8-only user.
Some of you may have seen my articles in Current Notes and/or my
posts here addressing the issue of whether Atari8's are "good enough" for
most home computer users. I'm putting that to the test now.
Oh, I've used the Atari as my primary computer for over a year
now. But, I always had that Clone (which was hand-assembled with hand-
picked boards and peripherals by me) to fall back on. It ran my BBS,
but I would also run some database and word processing aps on it from
time to time. And, when I didn't feel like booting the Atari, I could
always just tap the Alt key, type PC, and go from DesqView to Procomm
Plus in no time, while still running the BBS on that machine. It was,
in short, a convenience.
I can't do that anymore.
I decided to take down the BBS I had been running for five years
in two states. My significan other's sister and nephew wanted a computer
badly. I figured, without the BBS, I'd be mostly wasting that PC. So,
why not give it to them - they could put it to good use. Arrangements
were made, hard drives were swapped around, and the computer was
transplanted our apt. to theirs. I just got back from installing it
for them one hour ago.
Now I'm MicroSoft free. That feels good. :)
I'm confident the Atari will fill my needs quite nicely. Even so,
it'll be interesting not having a fall-back machine. oh, we do have one
other Clone, but that's my SO's machine, and I keep my hands off of it. :)

You know what kept me from sticking only to Atari all these
years (or any othe orphan computer, for that matter - I was using an Apple
/c between my fist Atari years and when I got my first Ms-DOS box)? Fear.
Yeah, I was afraid of not being on the cutting edge of computer technology.
I mean, if you don't have the latest stuff, you're nowhere right? You're
disadvantaged.
But you know what? It doesn't really matter. Maybe I'm indulging
in a bit of congitive dissonance resolution here, but it seems to me that
if you are always on the cutting edge, that means you are always buying
new hardware and software. That's a lot of money just to keep up with
the Gates'.
When you find your perfect platform (in my case, the Atari, obviously),
and you stick to it, you're coming out ahead. I mean, sure, some day
it will be impossible to run Atari software on an Atari computer - the
disks, drives, and other "fragile" pieces of the system will go kaput
someday. And at that time, I'll have to go out and buy the latest
computer, whatever that happens to be. But, in the mean time, I'm saving
a bundle of dough. And, I'm saving myself a lot of headaches. I don't

have to learn the quirks of the latest OS. I don't have to figure out what they've changed in the latest version of Word. Hey, no one is gonna change AtariWriter on me. :)
No computer lasts forever. What you use is a matter of personal tastes - it's your choice. So, given the choice, you better pick one you're most comfortable with.
I choose Atari.

Have a happy labor day, my fellow Atari enthusiasts.

-Joe

2490. fs: Chuckles' development system(s)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-03 00:00:00 UTC
From: cbueche@crl.com
Message-ID: <42dupu$9pi@crl12.crl.com>
Source record: 88724

Does anyone out there remember Chuckles? It's me.
During the 80's I did a moderate amount of development for
the Apple II, Atari 800, and Commodore 64. My credits include:
Laff Pak (Apple II)
Jawbreaker II (Apple II)
Jawbreaker II (Atari 800)
Lunar Leepers (Apple II)
Ultima II port (Atari 800)
Caverns of Callisto (Apple II)
Caverns of Callisto (Atari 800)
Ultima III port (Atari 800)
Ultima III port (Commodore 64)
Autoduel (Apple II)
Ultima IV port (Commodore 64)
2400 A.D. (Apple II)
Omega port (Commodore 64)

Anyway, I've still got all the equipment I used to develop these
games. This includes:

On the Apple II side:
one Apple II+, one Apple IIe, 16K RAM card, keyboard
extender, super serial card, two 5.25" drives, one duo-drive, paddles,
joysticks, one joyport, one EPROM burner with some socketed cards
that I think are for the Atari 5200. All documentation and (then)
professional-level hardware references, software tools, and third-party
references manuals.

For the Atari 800:
One Atari 800 computer, one Atari 5200 machine, two 5.25" drives,
all manuals, tools and references.

For the Commodore 64:
One Commodore 64 computer, two 5.25" drives, all manuals, tools and
references.

In addition, I have all the software and cables that allowed me to do
development/editing on the Apple and download images to the Atari or
the Commodore.

But wait, there's more...I also have all the system software for all
these systems, and whatever documentation was available, OEM and
third party. I can't remember the assembler I used, but I think
I have a couple of them.

I don't have a complete inventory, but I would also throw in all the games I have for these that I didn't write (I can't bring myself to ditch EVERYTHING!).

If anyone is interested in all of this as a lot, let me know. It's all been in boxes for years, and it's all available AS IS with NO WARRANTEE. It all worked when I packed it up. I don't even know if the disks are readable any more. I just want to free up the space it's all taking up.

I would include any kind of notarized letter requested certifiying that this was indeed the (more-or-less only) equipment used to develop the above-mentioned products. This is not a scam (who would go to the trouble?). I'm just tired of lugging this stuff around and never using it. Maybe someone else could get more out of it.

Anyone interested, please respond via email to: chuckb@craniac.com and I can get together more details.

Thanks,
Chuck Bueche

No, the problem is just the INDUS and the SDX, no fix. ICD said at the time
that the only real fix would be for someone to rewrite parts of the INDUS UCode.
Well, no one did and Future Systems who had bought out INDUS wasn't going to
touch it. What it boils down to is that the problem is in the INDUS UCode, but
I personally don't know where at. At one time I did run just 2 INDUS drives and
I don't remember having any problems. Didn't last as I needed my 1050 with the
BitWriter.
Just checked my SDX manual and I've made no notes in about this.
The serial number and date where writen on the inside front cover. Jan 29, 1989.

What, you too? I'm registering soon also. I'm waiting a little bit,
since I have too many toys to straighten out right now (like a c64
complete collection on CD, as well as someone gave a me a c128 and
1571 drive). I'l like to see all the 8-bit atari favorites on .atr
images (uncompress) on CD that would be plug and play with sio2pc or
PC Xformer. I'd blow $50 on a CD like that easy (that's what I payed
for the c64CD filled...)

Now that Happy emulation is sweet, I'm not sure if Happy drives are
supposed to boot at top speed from the beginning or not, but Isee he
boots DOS 2.0 and loads a driver. Is that the way Happy drives usualy
do it? I like SpartaDos in the fasion that it loads at mach 3 a few
seconds into the boot process...

XF551. Does anyone know exactly why it hasn't been done? Is it the MicroCode
in the 551?
The reason I ask is because I just finished upgrading my 1040STe's
720K Floppy to 1.44Meg with automatic control. The STe and the XF551 both
use the WD1772-02-02 controler chip, all that would be needed is some very basic
logic chips and a 16 Mhz Osc. (16.667MHz to be percise.) Of Course, you would
HAVE to have already upgraded it to a 720K before doing this change. It seems
like the only other thing needed would a Formatter to go to 18 Sectors per track.
(80 Tracks, Double Sided, 18 Sectors per track) A patch to SDX maybe? Or MyDos?
Humm, reading this over, maybe I discovered the problem. Anyway
possible to make the A8 read 1024 Bytes per sector? How does the A8 handle the
720K and 512Bytes per sector? Never looked into it.
Ideas? Suggestions? Answers? Post here or EMail.

Steve, if people are too lazy to hit "12" or "X12" in APE or SIO2PC,
they don't DESERVE a "flip disk" feature. :)

But - I do see the purpose, however... shareware versions of PC Xformer
don't let you swap disks in and out on the fly...

but... then again, that's WHY it's a "shareware" version...

I've downloaded this and tried it and it converts my DCM files okay.
However, when go into
Xformer 2.52, press SHIFT F10, type A then D2:, it lists the files with
some very unusual filenames, ie nothing that I can type in.

Any ideas please?

Thanks,
Phil

2498. Re: 1.44, XF551 - Possible?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-03 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <144802@cup.portal.com>
Source record: 88801

Rich: A huge problem with getting the XF551 to read more then 256 byte
sectors is it only has the on board 256 bytes of ram in the 8032/8052
micro. Back when Puff, Wooley, & I used to hang out on CIS at the same
time, I believe it was Wooley who said he had talked with the guy who
wrote the 551 code & he had a hell of a time even getting it to read
256 byte sectors. Said he had to store variables in the 8032's registers
& ports when the read happens or something like that. I'd just done the
first version of my program to read IBM disks & was bs'ing with Wooley
about the possibilty of doing full reads of IBM sectors by reading the
1st half of the sector into ram & sending it, then read the second half
to make up a 512 byte sector. As usual I didn't have the talent to rewrite
the ROM & Wooley didn't have the time, but Puff anounce within a couple
of weeks the CSS 551 upgrade that would allow you to read IBM disks.
I believe Wooley asked him in the public forem how he did it & I asked
him via Email, but as far as I could tell, he never responded to Wooley
& I know he never told me. Later I asked Wooley if Puff had ever replied
to him privately & Wooley said no, but he probably just used the double
read of the sector technique. This would make sense since the comments
I've heard about the CSS 551 reading IBM disks is it's incredibly SLOW.
So there you have it: If you don't want to rewrite the ROM, you're stuck
with 256 byte sectors. If you want do a Puff style upgrade, you're limited
to slow 512 byte sector access.
Off the wall, it's a shame Atari didn't spend a few more dollars on the
551, <Whoops! just remembered it's 8040/8050???> the 8040 could have
addressed a full 64k & had a real RAM chip in it. I believe that chip
also has things like hardware multiply built in! It would have been
a great hack to do things like switch the serial buss to high speed
& D/L-U/L things like a fractal generating program. But there's still
a lot of great hacks waiting to be done. As things like APE & SIO2PC
get more popular & the SIO chain gets gets better doc'd on the hacker
level we're liable to see stuff like that happening yet.

2500. *.NDX structure (PabQWK)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-03 00:00:00 UTC
From: mathniss@link.xs4all.nl
Message-ID: <42cmk9$kc3@link.xs4all.nl>
Source record: 88803

Howdy All

I while ago I promised James King to inform him about the structure of the
*.NDX files PabQWK uses. It might be interesting to more people, so here goes;

First 17 bytes spell:

pq20MM-DD-YYHH:MM

pq20 shows PabQWK it's reading the right iNDeX file. pq is in lower case.

MM-DD-YY month date year. The dashes are really in there. This date has to
the same as the one in CONTROL.DAT

HH:MM Hours (not AM/PM, but 0 to 23) and minutes. The ":" is really there.

then:

2 bytes showing the total amount of messages in LO/HI order.
(must be either 1500 or the right amount, otherwise the computer will
crash)

then, for every message, you'll find;

2 bytes showing the group number (LO/HI)
2 bytes showing the message number (LO/HI)
3 bytes showing the off set (LO/MID/HI) (read: amount of bytes between
the start of the first message and the current one.)

After the 7 bytes for the last message, you'll find two empty bytes (00) and
a "0B"

That's the whole *.NDX file.

The QWK format adds empty bytes to a message if necessary, so the total
amount of bytes used in a message can be divided by 128. Therefore, messages
always (when using SpartaDOS) starts either at the beginning or in the middle
of a sector.

In the halve sector where the message begins, you'll find the number of the
message at the top and the number of sectorhalves it uses on the bottom.

All this I found out, because PabQWK has the tendency to choke on HUGE
messages, like FAQ's etc. I wrote my own utility to calculate the off-sets
PabQWK couldn't find. (since PabQWK couldn't find them, I couldn't read them.)

After I finished the utility, I found an other faster way to get to the rest
of the messages. Find the last sector map inside the HUGE message and copy
the first sector behind the first sector map to the last sectormap in the HUGE

message. Then count the sectorhalves between the second halve of this sector (this is where msg 0 begins) to the beginning of the next message. Then change the directory entry for that file, so DOS thinks the file starts at the last sector map in the HUGE message. Then delete the old *.ndx file. Most of the times this works great. Yesterday it didn't. All worked but I couldn't scroll the screen to the right. So I couldn't view the right halve of the messages. I solve this, by taking 504 sectors out of the file. (sector maps start with the next and previous sector map numbers (two bytes LO/HI format) I "by-passed" a couple of sector maps and thus 252 sectors. The message ended up having less then 256 sector halves (I think this is the maximum PabQWK will take) and then all worked fine again.

Maybe I'm gonna try that last methode more often.

From: mathniss@link.xs4all.nl
Message-ID: <42cmkb$kc5@link.xs4all.nl>
Source record: 88804

Howdy Folks

I've noticed something funny when I'm using BobTerm at 14k4 with PRO Boards.

This is what happens.

Whenever I log on somewhere, I use my Capture Buffer.
When this capture buffer is full, it's contents is dumped to disk. I know for a fact, that my SupraFaxModem V.32bis (14k4) has a 1kByte buffer inside - and I'm not talking about the buffers used for Data (de)compression, I'm talking about an extra 1kByte buffer -. After BT's Capture buffer is emptied, the data (a bit more then 1kByte) flies over the screen VERY fast, then it slows down a bit (bit still very fast) untill the next save.

I guess what this comes down to is, the modem to computer speed is higher than the modem to modem speed. Is this normal (when connected to a PRO! board)? Seems like the modem to modem speed could be higher. If it isn't PRO!'s fault, it probably is mine. What am I doing wrong?

I mostly dial into PRO boards, so I don't really know/remember if it happens with other BBS software too.

BTW my modem does show it using LAP-M, DC, 14.4 (it has this nice display. Yep, I'm a sucker for shiny things, neat displays etc.)

Howdy All

Now that the heat stroke we had overhere (yep, had one in the Netherlands too)
my 130XE is starting to act up again.

Sometimes the screen turns green (not a nice green, but really ugly)
I have had this before, it was the POKEY then. And I guess it's the POKEY
since in very severe cases (especially when it's cold in my bedroom) it will
can't read a disk or won't even boot up.

This always happens when the computer is just turned on. If it hasn't happened
in the first halve hour, it's probably not gonna happen. And if it just turns
green now and then (without further effects) it also only seems to happen in
the first halve hour.

It's my 3rd POKEY I guess, ever since I let somebody install a GUMBY in it.
Maybe I should order a small amplifier circuit to protect it against sparks/
spikes when I hook it up to my stereo.

Could somebody confirm this? Could somethig else have gone wrong? Maybe when
the GUMBY was installed?

Hi all,

I've been playing Phantasie I, and I've just discovered (in the middle of the game) that disk 3 and 4 are screwed up, bad sectors.

I copied these disks from the original, and a re-copy revealed the same problem, my Phantasie I disks 3 and 4 are going bad.

I was wondering if anyone out there has Phantasie I, and if so, would they be willing to send me a copy of disk 3 and 4? I would gladly reimburse them for postage and their trouble.

Thanks in advance.

/Kevin

CC65. There's a tar.gz at umich that's intended to be compiled under
unix. I haven't had time to play with it yet, but I do have it on my
linux system.

>Ah.. but then my games/etc. would be as slow as BASIC.. damn! <:^[

C programs should be much faster than basic, but probably not as fast
as Action (though I haven't done any tests on that). The resulting
binary would probably end up bigger than it would with Action; again,
I haven't actually tried it, just a guess.

From: madaras@kosice.upjs.sk
Message-ID: <42e65d$bf7@sun.uakom.sk>
Source record: 88732

Just a sentence: I have meant, primarily, whether there is something like parameter in the command line of xf25x.exe file, which would allow to load these .rom files by executing the emulator. F.e. if I'd modify ROM area (international character set at $CC00 look pretty useless for me, so, thinking, it's not bad idea to replace this space with something more useful - some monitor etc.), I'd want to load it, but as normal ROM and RAM under ROM would be free for other purposes. Is there such possibility in versions 2.x ? { loading modified ROM into RAM-under-ROM is pretty idea, but sometimes one could have it "fixed" and to have hidden RAM free }.

2511. Spartados HD Images: How to make them bootable

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-04 00:00:00 UTC
From: stucker@nyx10.cs.du.edu
Message-ID: <42ejvf$r0r@nyx10.cs.du.edu>
Source record: 88733

(Bill, you might want to add this information to the emulator FAQ)

Bootable HD Images w/ APE/SIO2PC

Using large images with Spartados was always been a pain, because
once a hard drive image in initazlied with HDINIT it does not write
the appropriate xxxxx.DOS and boot sectors to make the image bootable.

Booting a HD image once initalized with HDINIT just results in
a 'No Dos' message. Here is how to fix that.

This has been tested with APE and Spartados 3.2g. Im not sure if
SIO2PC can use HDINIT, but this shold work with older versions of Spartdos
too. Obviously test first on a new blank image to be sure, and your
really should upgrade to 3.2g anyway since it supports much higher SIO
transfer rates.

You will need a copy of FTE's DISKRX.COM, a sector editor available
in the Fte directory of atari.archive.umich.edu, and a copy of the .DOS
file you want to install on your HD image.

Step 1) Using the normal COPY procedure (or XCOPY), copy your X32G.DOS file
to your HD image.
Step 2) Load DISKRX
Step 3) Get a directory of your HD image and write down the SMAP sector
number shown beside your X32G.DOS file. This should be
a HEX number between $00 and $FF assuming it was the first
file you copied to the disk.
Step 4) Still using your HD image, load a copy of sector 1 into memory.
Step 5) Choose the EH (Edit Hex) feature, and move your cursor to
the cell marked $28 (its like the first byte a few rows down). This
is the pointer to the SMAP of your .DOS file. Notice on your Hd
it is set to $00.

Setp 6) Enter the SMAP number you got from the directory listing into this
cell and WRITE sector 1 back to your HD image.

If all went well your HD image should now be bootable. Whee! :)

>Nobody talked about it here on c.s.a.8?

Yes, you have!

My personal views on APE:
As a registered sio2pc user I would say that APE does seems to address some
or most of it's shortcomings.
However most of those features are CRIPPLED in the distributed version.
That means that you cannot test them out and get addicted to them before
registrating at a @#@ $39.99. Maybe it's twice as usuable as sio2pc but
shouldn't cost 4 times as much IMHO.

Some lacking features in APE that would be nice at $39.99:

* Support for Buffered I/O (16550) What I want to be able to do is to have it
running under a multitasking OS, as of today only one OS will multitask
DOS-sessions correctly and that is OS/2. (No, not W95, Desqv, W3.1 etc)
(Maybe some UNIX-flavour or Novell-dos 7 can multitask DOS in a
non-cooperative fashion as well?)

* Screen blanking. Shouldn't be too hard to implement, the way sio2pc does
it would be enough.(maybe implemented, couldn't find it though)

* Printing to a file. Very useful if you have a doc or something that you would
like to spiff up on the PC first before printing.

So, I still have to boot DOS to use it (sigh)
and the only advantage that the shareware-version gives me over Sio2pc
is the enhanced ATR-file management.

Please un-cripple the distributed version and half the registration fee and
start working on 16550 support, when it's done I would say $39.99 is a
decent price..

>Get it..

At least try it out, if you don't have a BB or similar device, it might be
worth the buck.

> around of all the things I have)

Yeah, I am going to miss my text editor for the MS-DOS machine. I
used a shareware (registered!) editor called Boxer. It is great, the best
I have ever found on any platform. It was great for quickly preparing
lengthy posts for upload.
On the other hand, I do like AtariWriter and always have. It'll
be fine. I hope. :P

> 2. Telix - since I can't telecomm with my XL

Why can't you? No interface? Or is it that Flickerterm and the
other 80-column term program (dang, don't you hate it when you can't remember
something while you're typing a message![G]) can't handle whatever your
service provider requires?
Anyway, if it wasn't for FlickerTerm, I wouldn't have been able
to switch. No way am I going to give up 80 columns for callouts. But,
with FT-80 I have as good a term program for what I do when I call out,
since 99.9% of the time I'm reading and posting messages. I do wish
it had an ASCII upload feature, so I could compose offline and upload.
But,when I need to do that I can go into BobTerm.

> 3. SIO2PC/APE - since I don't have a hard drive for my XL

I don't have one either. Haven't needed one so far. We'll see as
time goes on, eh?

> 4. CShow - 320x200 > 80x200 even though 4096 > 256 (but that 256 is out of
> 220,000+...)

Sounds like you do a lot of graphics work. Ever tried RAMBrandt?

>I've gotten lazy. I've fallen in love with Unix, I'm becoming a C user
><shudder>, and I'm SERIOUSLY getting SICK of the quirks of Action!

I learned C long before I ever tried Action!, and that's what
made me view Action as not worth the time. (Not saying it's not worthwhile
for others - the frustration of it's quirks just wasn't worth it for /me/.)
instead, I'm doing my darndest to learn to use Mac/65. I like it
a lot, and I've made some useless programs in it in order to learn how
to do different things. Once Rich Gore ships the Yorky 256K module to me,
I plan to work on a larger project. I'm looking forward to that very

much.

>(oh, and the sometimes downright insulting comments about my pretty-best-tries
>when it comes to making new XL software <:^[ ).

I must not have been paying attention - I thought your work was
well-regarded. That's the impression I got anyway. No, I don't have
any of the programs you've written - as alluded above, I rarely download.
Anyway don't let the disparagers get you down. I released a door game for
the BBS software I used to use, and got quite a bit of disparaging feedback
from my own users. But, you know what? It was the second most popular
game on my BBS. And, other sysops actually paid for a registered version
($20). So, it must not have been all bad, eh? There's always gonna be
people who want to throw excrement on your work. And there are a lot of
people who are just honestly making what they feel are constructive
criticisms. It seems that it takes a truly wonderful program in order
to get people to praise, but if a program has even the tiniest flaw, there
will be loads of people who will feel compelled to criticise. :) (Not that
I don't criticise, mind you:)

>So, for now, the only programming I'm doing is on Unix.......

That's too bad. I hope you get back into the Atari at some point.
Lord knows I strayed away for /years/, wandering to Apple //c then IBM/Clone.
Took me 5 years to get back to atari, then another 5 to realize that's all
I need. :)

: William Kendrick <kendrick@zippy.sonoma.edu> wrote:
: >Nobody talked about it here on c.s.a.8?

: Yes, you have!

: My personal views on APE:

: As a registered sio2pc user I would say that APE does seems to address some
: or most of it's shortcomings.
: However most of those features are CRIPPLED in the distributed version.
: That means that you cannot test them out and get addicted to them before
: registrating at a @#@ $39.99. Maybe it's twice as usuable as sio2pc but
: shouldn't cost 4 times as much IMHO.

: Some lacking features in APE that would be nice at $39.99:

: * Support for Buffered I/O (16550) What I want to be able to do is to have it
: running under a multitasking OS, as of today only one OS will multitask
: DOS-sessions correctly and that is OS/2. (No, not W95, Desqv, W3.1 etc)
: (Maybe some UNIX-flavour or Novell-dos 7 can multitask DOS in a
: non-cooperative fashion as well?)

Its not lack of buffered IO, its lack of machine speed. Timing is very
tight. If you go buy a P-100 im sure you can run it under windows.

: * Screen blanking. Shouldn't be too hard to implement, the way sio2pc does
: it would be enough.(maybe implemented, couldn't find it though)

This is included in 1.06

: * Printing to a file. Very useful if you have a doc or something that you would
: like to spiff up on the PC first before printing.

Excellent idea, ill make a note to add it.

: So, I still have to boot DOS to use it (sigh)

What did you want to boot?

: and the only advantage that the shareware-version gives me over Sio2pc
: is the enhanced ATR-file management.

So you have more than Sio2PC already.

: Please un-cripple the distributed version and half the registration fee and
: start working on 16550 support, when it's done I would say $39.99 is a
: decent price..

Its crippled to get people to try it out. I have invested a good 1000+ hours of time creating the software and have no intentions of giving it away free.

And again, 16550 has nothing to do with your machines inability to maintain proper SIO bus timing. The timing has to be exact, and since your taking time away from the program it will never work.

: >Get it..

: At least try it out, if you don't have a BB or similar device, it might be
: worth the buck.

Actually the whole point of APE is to elimiate the need for such devices and at a fraction of the cost.

: I hope I wasn't too discouraging?

Actually its about typical of the e-mail I have recieved. After 1000+ hours of work, RS232 and protected disk image support is seems its worth about the price of a hamburger to most 8 bit Atari users. The same users who will shell out $500+ for slow 1050 disk drives, harware interfaces to obselete hard drives, expensive external modems, RS232 interfaces, etc.

I didnt expect to make any money off APE when I started coding it, but the attitude of most of the e-mail I have recieved makes me wonder if Im wasting my time making it available at all.

Pay no attention to the people who p*ss & moan about Atari8 software -
many of 'em still won't admit that no one writes software for it anymore.

As far as the long list of silliness at the beginning of his message, I have
long ago decided that there will never be a Unix (or whatever he seems to
want) for the Atari8, and have learned to live with it.

Fredrick, just a 'Point of order' My oldest son has A DX4 100 MHz, VLB computer & he gets so many NAKs under OS/2 that IMHO: SIO2PC is unusable. Figure almost 50% of the time this NAKs cause saves to fail to work, disk boots to fail, ... IMO <since I'm not going to buy a hot clone in the next few months> 16550 support may not help the problem. Thing is, right now the SIO2PC hardware is tied to the ring indicator which as far as I can tell is one of the lowest priority interupts you can generate on an 8250, assuming it even CAN generate an interupt: I'll have to look at my docs. It probably won't matter if there's 2 byte buffer or a 100 byte buffer if the clone doesn't get around to ACKing in time. Hind sight is always 20:20, but the SIO2PC hardware probably should have been tied to DCD, I believe that can generate an interupt in something like 200 nsecs. You know what I'd like to see? SIO2PC type software burned into a ROM & put on a IBM card, any card! Funny thing is, IBM use almost the same type of initialization as an Atari cart does. On boot the bios searches for something like an $AA $55 as a flag byte in the hardware region, if it finds the bytes it then jumps to the on board ROM of the card. So if you had something like a old 8 bit RLL or MFM controller, you could just pop out the existing ROM & insert the Atari interface one. I'd like this since I have a plethora of clone mother boards, but not a heck of a lot of monitors to go with them. *BUT* in the last week I've had 4 broken computers brought to me to be fixed & throw in a busted 1200XL I picked up for $2.99 at a thrift store & fixed and I know it'll NEVER get done. Also fixed an electronic typewriter & CGA monitor, sheesh! Problem is people have me figured out, I tell them to drop the stuff off & they know it well get put in my pile of things to do so they now tell me, "I'll just wait here until you finish it." My list of Atari things to do is growing HUGE since most of these projects are clone stuff.
I did take a look at PKZIPJR.COM, the stripped down MS DOS version of of zip, 2750 bytes! & I think about 800 of that is the instructions. Once again, it doesn't look like a Unzipper for at least a 130XE or better should be a problem other then you have to know 8086 & 6502 assembly language & have a month of free weekends to burn to do the translation. I guess that's how CC65 was done from the Tiny C source, but Dunion is no longer with us.

Does anyone have a program/proven method for converting 8-bit files to a PC? I want to buy my father a PC, but he has years of files on his 130XE, including a genealogy file/document that he doesn't want to lose. (I believe it's written on AtariWriter+) A terminal program would be OK, a way to convert them via null modem would be even better; we live about 80 miles apart & he doesn't have alot of modem experience. Thanks in advance for help!

>Figure almost 50% of the time this NAKs cause saves to fail to work,

Just for info, but I just swapped my HD controller from a 16-bit w/16450's to a VLB w/16550's and it has made a world of difference to SIO2PC. This is on a DX4-100. Before, I constantly would have problems where a file transfer would pause for 5 secs or more before continuing. Formats of disk images would fail about 50% of the time, and sometimes my PC would reboot for no apparent reason. Since my upgrade, very rarely I get a pause measuring in milliseconds, and never any other problems. Before I had the SIO2PC cable connected as COM1 and a switchbox to swap between mouse and SIO2PC. Now I have it on COM3 with no IRQ, so I can have the mouse on COM1 and modem on COM2. All these comments are for DOS 6.2. With Win3.1 or Win95 it works for shit.

Most of my stuff is games; some of it for a while was simple video/audio demos; some of it includes utilities. >I'm< actually pretty sad that my FAVORITE program is NEVER used.. of course, it used APAC, which everyone regards as sucking nowadays because of Colorview, but they seem to forget the SIZE differences in an APAC image compared to a Colorview image. 8 or 16K compared to 24K. I cannot for the life of me fit a Colorview image in memory when working with Action! (without going out of the plain 24K).

Anyway - my favorite program of mine, BTW, is Colorizer.. which has taken QUITE a few of my old boring 16 shade ComputerEyes captures and turned them into beautiful color images. :)

I'm still with the Atari - now I want to make a Mortal Kombat / Archon mutation with digitized sound effects.

I might even do it. :) And of course my home page is STILL full of pages explaining ideas for games which I haven't touched in months.

Anyone remember "Geneocide?" :)

I think what I REALLY need is simply a better, newer, Sweet16-upgraded version of Action!.

Sure, my software will then be useful to only 1-2% of the Atarian population, but I will be forever known as one of the first Sweet16 supporters.. :)

And my games shall RULE! :)

From: rziegler@sover.net
Message-ID: <42ea0m$k6m@thrush.sover.net>
Source record: 88744

On 4 Sep 1995 06:00:14 GMT, kendrick@zippy.sonoma.edu (William Kendrick) wrote:

>In SIO2PC "X12" is: e[X]change - disk [1] and disk [2]
>In APE "12" is the same thing, but you don't need to type the [X].

I figured this out a little late, and addressed in in the "BTW" at the end of my previous post.

>BTW, I thought your "X12" was F12, so I assumed you were talking
>about macros, not SIO2PC. Sorry. I still addressed your concern
>though.

On another note, I've reconsidered what I wrote the auto flip feature being more trouble than it is worth. If there was a key one could press after the desired flip sector was read to define that as the flip sector, a manual editor to manage the flip sector(s), and a toggle to turn the flip sector feature off without modifing the .ATR, it would be a very good thing indeed.

Just think how great it would be to demo APE at your local 8-bit computer meeting, and be able to say smugly to the (mostly C=64) audience, "APE even flips the disk for me."

Oh... Thats just me... :)

But seriously, there are many reasons for this improvement:

1) Unclutters Directories
2) Potential Auto Flip Disk feature
3) Reduces need to press "12" or "x12" (seems lazy, but cool)
4) Lets you actually have 8 virtual flippy drives online, not 4
5) Leaves door open to new dimensions in data storage. (5 sided disks :)

This is wholly practical actually, as it lets developers cater to the LCD of Atari users, i.e. those with a 1050 or 810 and no other platform to run APE, SIO2PC, MAC2PC, etc., while at the same time provide a "hard disk version" to APE users, i.e. one large file that contains however many disks they need. The actual code wouldn't have to be changed, and the app, game, demo, could be configured to either prompt for flipping the disks or not. If not, the double sided 10 disk game of our dreams would run seamlessly, without any "insert disk 6, side 2, please", while at the same time not deny this wonderful game to users of an unmodified 810.

I don't think anybody can argue this one away! :)

Rick!!

Does your father have an 850 interface to go with the 130? Also what type of drive he has can be important if it's a double density model like the XF551 or Indus. I've also read in an old Atari Explorer you can just load the RS232 handler with Atari Writer, establish a phone link between the two modems & save or print the doc to the R: device but I've never tried it myself.

>Where can one find Boxer? Also - Textpro is VERY nice on the Atari side,

I found it on CI$, and it should be elsewhere. Dunno where on
the 'net tho! :(Hmm..lemme see if I can find the docs, and see if it
says anything about a support BBS or something...
Ah, yes, here it is: BBS: 603-924-3859.
Boxer is pretty cool for editing programs - you can set it up
to recognize C functions and such, and it'll auto-indent for you AND
colorize the various functions, kewords, etc. for you - each type in
a different color. I liked that a lot, since it meant I could do a quicker
visual scan to find things, etc. Download it and see what you think!

>Where can one find Boxer? Also - Textpro is VERY nice on the Atari side,
>too.. macros, modules, everything!

I tried Textpro, but I guess I didn't put enough time into it.
I found it to be confusing. Hmm...no, now that I think about it, what
I was trying to do at that time was write programs in C on the Atari
(using...Lightspeed? Hmm..I forget which flavor...Deep Blue?), and I
think there was some sort of problem to do with redefining keys or
something. I think I redefined a Control-key combination to give me a
curley brace, and another to give me the other curley brace - I was coming
off of the IBM, and having the braces on the screen felt better. Anyway,
I messed around with it and got frustrated. Might be that if I loaded it
up again and tried to use it for something less esoteric, I might like it.
Thanks for reminding me of it! :)

>Yep - no interface. I can't imagine what service provider would want more
>than VT or ANSI.. except the Win/Mac lamer ones like AOL. :)

Yeah, nothing like requiring a proprietary interface program, then
releasing it only for the top two computer types, eh? :(If Delphi ever
drops its command line interface, I'll be mightily upset.

>Not editing (yet; I can't anyway with CShow; and at most much of my editing
>would be just that - editing, not drawing original art; cropping, color
>cleaning, etc.). Viewing junk I get off the 'net and the Web.

Ah. Serious graphics work is one of the few reasons to use the
latest Windows/Mac system. Carole (my girlfriend) uses CorelDRAW! all the
time, and thus we have a 486/50 (I know, it's getting old) with 32 MB RAM.
Here I am on a 64K Atari, and she's whizzin around on that machine. :)

>Anyway - my favorite program of mine, BTW, is Colorizer.. which has taken
>QUITE a few of my old boring 16 shade ComputerEyes captures and turned them

>into beautiful color images. :)

Hmmm...it does this automatically? Sheesh, not even CorelDRAW! can
do that. You can change a greyscale image to a color image, but all that
means is that it provides the memory to save the color information - you
have to colorize it by hand. Your Colorizer program sounds pretty
impressive!

>I'm still with the Atari - now I want to make a Mortal Kombat / Archon
>mutation with digitized sound effects.

Hmmm...chess board, but the combats are Mortal Kombat style? Sounds
good!

>I think what I REALLY need is simply a better, newer, Sweet16-upgraded

Killer. Once MIO2 comes out and I get a P:R:Connection, I'm gonna stop using this PC - well, maybe for CShow until a scrolling, JPG-decoding, Sweet16-based JView comes out, but seriously - all I use this PC for nowadays are:

1. Edit every once in a while (I don't like any of the WPs/Editors I have on the XL.. Action!'s built-in editor is lovely.. TextPro is cool.. and sure, MS Editor can be a pain in the rear, but it's easiest to get around of all the things I have)
2. Telix - since I can't telecomm with my XL
3. SIO2PC/APE - since I don't have a hard drive for my XL
4. CShow - 320x200 > 80x200 even though 4096 > 256 (but that 256 is out of 220,000+...)

Ah - but.. unfortunately, other than games and demos, I've done nothing but the above (telecomm, gfx), so actually, other than games and demos, I've not done anything on the Atari.

I've gotten lazy. I've fallen in love with Unix, I'm becoming a C user <shudder>, and I'm SERIOUSLY getting SICK of the quirks of Action! (oh, and the sometimes downright insulting comments about my pretty-best-tries when it comes to making new XL software <:^[ ).

So, for now, the only programming I'm doing is on Unix.......

Which brings up a very good question - didn't I hear about some C compiler (for Unix or in general) which spits out 6502 code? :^)

Ah.. but then my games/etc. would be as slow as BASIC.. damn! <:^[

2530. WANTED: Atari 8-bit HARDWARE

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-04 00:00:00 UTC
From: mbates@stocko.com
Message-ID: <mbates-0409950227410001@ppp12.stocko.com>
Source record: 88752

I would like to purchase the following items. I will pay cash if
necessary I also have a lot to trade with (8-bit and otherwise) here is a
short want list. I want them working. I have gotten quite a few things
from here recently which have not worked and would like to avboid that if
possible! :-)

Atari Hardware wanted (with boxes and manuals preffered of course)
XM301 Modem
1010 Cassette Drive
1020 Printer
1029/XMM801/XM121 Printers
822 Thermal Printer
Cartridges I do not have

OH YEAH - Amdek 3" drives! :-)

okay, here is a dreaming list:
1400XL/815/1090 yeah yeah but I dream large!

Thanks for all the help. I am also VERY interested in Compute! and Family
Computing Magazines

(Rob Funk says 'ANALOG' programs made either cassette or disk.)
I agree with Rob. The program should give you a choice of cassette or
disk. However, if you cant say disk, then you can't just change the
"C:" to "D:filename.ext", there is a load address at the beginning and
a run address at the end which has to be there for a disk file.

2533. What Colorizer does (Was Re: A Matter of Choice)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <42gfhf$7ke@nic-nac.CSU.net>
Source record: 88656

Heh - Joe, NO Colorizer doesn't "do it for you"! Of course not!! :)
How would it know how!!? Better yet, how would >I< know how to make IT know!?
;)

It's mainly just a pretty simplified paint program which draws in 16 colors
- either on the bottom half of the screen (with the greyscale up top)
(and unfortunately the 16 colors turn to 16 shades in this view mode I think)
or blended in (APAC-style) with the original (or, half of it, actually) grey
image.

For example, I had a picture of Captain picard in his ready-room which
I captured in 80x192x16 shades.

I load it up with Colorizer. Now I have a (still fullscreen) 80x96x16
shade image. I select a yellowish color and outline his head. I then
fill it in. Viola.. now it's a greyscale image with a little bit of
"yellow-scale". I then outline other bits- the walls; fill them in brown.
His clothes - fill them in red. I keep the tabletop the way it is (greys/
blacks) since it's really just black, and viola.. I now have an
80x96x256 color image - err, well, of course not all 256 colors were used..
maybe 64 at the most in this example, but you can see the usefulness of it.

Looking at a picture in greys only loses quite a bit of information.

Now what I have to do is make a Colorview editor/painter. And I'm seriously
thinking of ways to do it! ;)

2534. PC XFormer 2.52 double density disk images

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: ddezinski@mail.cbf.com
Message-ID: <42g74p$jnm@oxy.rust.net>
Source record: 88657

Has anyone used double density .ATR files with SIO2PC and PC XFormer, I've
been playing around with it and seem to have uncovered a bug in PC XFormer.

Format of PC XFormer double density ATR files:

```
ATR Hdr 16 bytes
Sector 1 128 bytes
Sector 2 128 bytes
Sector 3 128 bytes
???????? 384 bytes of zeros
Sector 4 256 bytes
....
```

Format of SIO2PC double density ATR files:

```
ATR Hdr 16 bytes
Sector 1 128 bytes
Sector 2 128 bytes
Sector 3 128 bytes
Sector 4 256 bytes
....
```

I've got a 16 Meg ATR file that I use with both programs, and it is a pain to
process this file (add the 384 0 bytes) everytime I switch between PC XFormer
and SIO2PC. Has anyone else seen this?

Thanks
Dave Dezinski

n> out there has it, could you please post it here? Thank you.

The program that you want is PK-PAK. I have never had a problem
de-archiving a program that was ARC-ed under PK-PAK. The problem is that
ATARI .ARC is so old that it uses 8-bit machine words. Some of the older
versions of the IBM ARCs have an "o" switch for "Old Format" or "Backward
Compatibility" mode which will create .ARC archive libraries that ATARI
SUPER-UNARC is able to decompress. My understanding is that the purpose of
PK-PAK was to take some of the older formats such as PACK, 8-bit ARC, etc.
out of PK-ARC since "ARC" was a licensing term of S.E.A. Technologies. The
old formats went into PK-PAK, and the new formats went into PK-ZIP, and the
term "ARC" for a particular style of archive program reverted back to
S.E.A. Technologies. So ... Phil Katz now calls his old archiver PK-PAK
and his new archiver PK-ZIP. (Well, relatively new .... You may recall
some similar broo-ha-ha now going on with the "GIF" compression format.)
That is my understanding (which, of course, could be totally wrong).

>about this and he said that:
>
>1) It would greatly slow down disk access (you'd have to read each 512k
>sector twice) for the current interface.

I has just written a routine to handle the IDE drive. First version of it used only half a sector. The disk speed was 25 KB per second in reading and about 13 KB per second in writing.

Now my routine uses whole, 512-byte sectors and it really slow down disk accesses: the disk speed in writing is only 7 (seven) KB per second, because the handler must read a sector before re-writing it. But in reading my drive is FASTER: in reading it reaches up to 31 KB per second. If you work with standard DOS and 256-byte sectors, of course, because my handler must emulate them. If there was a DOS, which could use a 512-byte sector as an allocation unit (like TOS or MS-DOS), the drive will reach over 52 (fifty two) kilobytes per second while reading.

The general problem is, that each 512-byte sector eats about 5888 clock cycles, if you read it from a 16-bit port (i.e. from a two 8-bit ports). Additionally, you need to perform two divisions. This operation eats A LOT of cycles (about 2000 each). The divisions are necessary (although its routines perhaps may be faster), and all you can improve is the reading a sector. It may be improved by installing DMA for the disk in the XL/XE. My friend supposes, that it could speed up disk operations dramatically. Anyways, although the 5888-cycle routine will be eliminated, the divisions will still be necessary (2 x 2000 cycles), and the disk speed may reach about 100 KB per second in 'native' mode. The speed may be perhaps improved by 'intelligent' caching etc....

>...
>in his opinion with the low cost of IDE drives at the moment and the rather
>small demand on disk space of most Atari programs. I have to admit, more
>than 20meg or so seems like overkill (except for a BBS) for the average
>user of an Atari 8 bit. ...

My disk is 30 MB, and a half of it (about 15 MB) is free. If I didn't write a handler, that uses both halves of a sector, my disk was full now...

BTW: is there a program, which can defragmentate Sparta-disks?

>Its not lack of buffered IO, its lack of machine speed. Timing is very
> tight. If you go buy a P-100 im sure you can run it under windows.

Well, 1. I don't think it will run under Windows 3.1 in a nice manner even
on a P100.(I used one at work this sumer, while copying some files to disk
nothing else could be done)
I would like it to run in OS/2 though.
I am not into Intel assembler, 8520, 65550 programing at all however:
Timing is very tight between bytes in a sector, a sector is betw. 128-256
bytes. if you could put 8 bytes in a buffer at regular intervals and
let the 16550 shift these out at 32800 bps (say) then you only have to
feed the 16550 1/8 of the times you would have too feed a 8250 (or whatever
its name is) This is how high speed modems are made to work under etc. os/2.

So It should be possible to make it work in a disk-only environment I guess.
(I understand that emulating modem-transfers etc could be more nasty for the
APE)

>What did you want to boot?

OS/2! :-) (which let me do high-speed z-modem downloading in the back-
ground on a 386 running the DOS program frontdoor while being able to do
other stuff)

>So you have more than Sio2PC already.
>
yes, Black-box etc.

>
>Its crippled to get people to try it out. I have invested a good 1000+ hours
> of time creating the software and have no intentions of giving it away free.

I wouldn't wanto either, however I just don't like the idea of cripleware,
Why don't you think people would register if you distributed the full-blown
version ?
If it does everything you promise even I would concider it for myself and
my Swedish friends, now with this IMHO rather high price and crippled
distribution I would say that your product is more likely to become
pirated. (do like Micro$oft, offer a cheep OS and then cheep upgrades :-))

>
>I didnt expect to make any money off APE when I started coding it, but the

hope not.
Scince this offering isn't aimed at me as a customer I can understand 39.99
but at a lower? fee maybe a lot of people not really in need of this
program could get it together, I for one is a relatively poor student and
cannot shell away $39.99 +$10 (exhange etc fee) on everything and her mama.

With friendly regards

2549. Atari OS image for rainbow

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: younga@ucssun1.sdsu.edu
Message-ID: <42inl8$rra@gondor.sdsu.edu>
Source record: 88672

I got rainbow, however my old 800XL no longer works. Therefore, I cannot get the required OS image out of my 800XL. Not to mention, I don't have an 850 Interface module. Is there any way I can get a hold of an OS image? I have always been fond of the Atari 8bit line. It was the computer that got me started with my current carrer - software engineer. Can anyone help me? I know there are copyright issues here but I hope Atari won't mind too much since I'm such a big fan and have a broken 800XL in the closet. :-)

thanks,

-Aaron Young

2550. FS: 800xl + PS for $12

Get an Atari 800xl in great condition with the hard to
find power-supply for only $12. Start playing those great
8-bit cartridge games you've been missing. This unit is in
great condition, with no fading or major blemishes.
Please add $5 for shipping to the contiguous 48 states.

2551. Re: What Colorizer does (Was Re: A Matter of Choice)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <RpFgstn.ransom22@delphi.com>
Source record: 88674

William Kendrick <kendrick@zippy.sonoma.edu> writes:

>Heh - Joe, NO Colorizer doesn't "do it for you"! Of course not!! :)
>How would it know how!!? Better yet, how would >I< know how to make IT know!?
>;)

I'm obviously no expert on this subject, but it seems to me that
it would be possible to make a translation table. I mean, does Turner
really have people colorizing entire movies by /hand/,frame by frame?
Granted, this is probably impossible on the Atari, but one would
think a program like CorelDRAW! would be able to handle it . . . but it
can't! Strange.

>For example, I had a picture of Captain picard in his ready-room which
>I captured in 80x192x16 shades.
>
>I load it up with Colorizer. Now I have a (still fullscreen) 80x96x16
>shade image. I select a yellowish color and outline his head. I then
>fill it in. Viola.. now it's a greyscale image with a little bit of
>"yellow-scale". I then outline other bits- the walls; fill them in brown.
>His clothes - fill them in red. I keep the tabletop the way it is (greys/
>blacks) since it's really just black, and viola.. I now have an
>80x96x256 color image - err, well, of course not all 256 colors were used..

Ah, now I understand. Thanks! :)

-Joe

Source record: 88675

Howdy,

I just received my Yorky 256K Upgrade from Richard Gore. I plugged
it into my 800XL (a simple matter of putting the p/s plug into the yorky,
the Yorky "p/s out" plug into the 800XL, and the PBI connector into the
PBI slot), booted SpartaDOS X, and I now have an 11 bank RAMDisk. :)
It runs MegaBlast (which requires a 130XE) perfectly, as well as
other "130XE only" programs. It's fully RamboXL compatable, too.

Man, this is gonna be great!

(Sorry, just had to gush about this, as I think it's pretty
neat:)

2553. Interested in IDE-Harddisk-controller ???

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.253.0009D0F4@genesis.informatik.rwth-aachen.de>
Source record: 88676

Hello !!!

An over one year developing project will be ended in the next few weeks !
Our IDE-controller board is ready for production now and will be availiable
on the ABBUC-JHV on october 28 1995 in Heerten/Germany.

Because we want to sell the exemplars just on the JHV, and not just showing
them, we have to know how many people are interested in such a thing.
We will the boards have produced by a professional firm an so we need an
relativly exactly figure 'cause it's very to have lot's of borads less or
more than you could sell.

Here the figures:
-it's a real PBI-Device (runs only with XL -or XE with adaptor)
-supports single IDE-Harddisks 'till 504 meg a this time (but we'll working
on a LBA-mode and master/slave solution - a question of software only)
-emulating a 16 bit data bus
-use's the full capacity of the drive by splitting a 512 byte sector in two
256 byte sectors (of course, this slows down the performance a little bit,
but this doesn't matter we think)
- we have no exact speed figures (they will follow), but you have DISKRX (
diskmonitor by SPARTADOS) with over 32kBytes up in ca. 4 seconds !!!
-the controller-register are direct programable, so the a ATAPI-CD-ROM
solution is easy to do
-supports partitions up to $FFFF sectors (16 meg).
-up to eight partitions avialiable at one time
-stand alone bootable (you will not need any disk drive)
-running with BW-DOS,Sparta and MyDos
-you will need an external power-supply

There's no exact calculation yet, but the price will be something around
DM 100 for the board with all tools ...
We only want to sell it in Germany first - but also interested in selling
all over Europe - if someone could tell us what we have to do then !

Please mail to me if you are interested in buying one or want to have
closer information.
Please make a remark if you have already orderd one from ROLAND BUEHLER, so
that there are no double countings !
Ask your friends ...

Thanks
Matt

2554. DCM2ATR 1.3

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-05 00:00:00 UTC
From: cmwagner@gate.net
Message-ID: <42g696$1gs8@news.gate.net>
Source record: 88755

DCMTOATR 1.3 is now available. Minor enhancements were made. XFD
images can now be created on the fly with the 'x' switch. The default
is an ATR image.

It is available from:

ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr13.tar.gz

or

ftp://ftp.gate.net/pub/users/cmwagner/msdos/atari/dcmatr13.zip

MS-DOS executable is included, as well as the C source code for
compiling under UNIX and other platforms.

2555. Wanted: Atari 8-bit Gyruss cart.

Subject says it all. I'm looking to purchase or trade for an Atari 8-bit Gyruss cart; a computer cart (I own an XEGS, so an 800-series cart should be fine) would be ideal, but I wouldn't mind a 5200 version as well.

If you have one that you might part with, please mail me with pricing or want-lists. I collect games for virtually all pre-NES systems, so I may well have something you're looking for.

jeff. of course, cash is just fine, too.

NOTE
This list now includes cartridge based software, as well as hardware.

updated 09/06/95

I have the following 8-bit computer equipment for sale or trade.
The list includes software and hardware from Atari, Commodore,
Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Snail. The shipping cost
depends on both the weight of the package and the distance that it
is traveling. Buyer has the choice of either first class or parcel
post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 7.50 ATARIWRITER
$ 7.50 BASIC
$ 6.00 GALAXIAN
$ 9.00 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

*****

COMMODORE 64 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 9.00 FAST LOAD (Epyx)
$ 7.50 FROGGER (Parker Brothers)
$ 5.00 JUPITER LANDER
$ 5.00 KICKMAN
$ 5.00 MAGIC DESK I
$ 5.00 MUSIC COMPOSER
$ 6.00 OMEGA RACE
$ 5.00 SPEED/BINGO MATH

Complete cartridges. With box, and manual:
$ 7.00 KICKMAN

*****

COMMODORE VIC-20 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 5.00 ADVENTURE LAND (#1914)
$ 5.00 ALIEN (#1906)
$ 5.00 AVENGER (#1901)
$ 5.00 GORF (#1923)
$ 5.00 OMEGA RACE (#1924)
$ 7.50 Q*BERT (Parker Brothers)
$ 4.00 RADAR RAT RACE (#1910) -- no label
$ 4.00 SPEED MATH / BINGO MATH (#1933)
$ 5.00 THE COUNT (#1917)

Loose cartridges with manual. No box:
$ 5.00 COSMIC CRUNCHER (#1922)

*****

TEXAS INSTRUMENTS (TI 99/4A) COMPUTER:

Loose cartridges, no box or manual:
$ 4.00 ADVENTURE
$ 4.00 BEGINNING GRAMMAR
$ 4.00 BLASTO
$ 4.00 CAR WARS
$ 4.00 CHISHOLM TRAIL
$ 4.00 HOME FINANCIAL DECISIONS
$ 4.00 HOUSEHOLD BUDGET MANAGEMENT
$ 4.00 HUNT THE WUMPUS
$ 7.50 JAWBREAKER II (Sierra On-Line)
$ 4.00 MUNCH MAN
$ 4.00 PARSEC
$ 7.50 PROTECTOR (Atari)
$ 4.00 TI INVADERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER with box, User's Guide (175 pgs.), power
supply, and RCA cable.

I will also throw in a second non-working COMMODORE 64 for parts,
FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #8

COMMODORE 1541 DISK DRIVE with power cord, and serial cable.

$25.00

*****

LOT #9

COMMODORE 1541 DISK DRIVE.

Power cord and serial cable are available from Radio Shack for
around $11.

$20.00

*****

LOT #10

NEW RF SWITCHBOX PURCHASE OPTION

RADIO SHACK COLOR COMPUTER with RCA cable, built-in power cord, and
built-in BASIC.

This is a complete system, except for RF switchbox.

$14.00

*****

LOT #11

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF
switchbox, Beginner's BASIC (150 pgs.), and one function key strip
(for keyboard).

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to use.

$25.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video
game systems and/or cartridges in trade towards any of these items.
Systems I am interested in include, but are not limited to, the
following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need Atari color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need TI color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking
for now is software (primarily cartridge based).

Please send a list of what you have, and I'll let you know what I can offer. Please be specific, and indicate whether or not items (cartridges and/or systems) include the box and/or instruction manual. Please also mention any controllers that are included.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

The Atari 8-bit Hardware Upgrade,
Modification and Add-On FAQ
==================================

| | |
| | |
/ | \

Version 0.1

Dated February 18, 1995

Maintained by: David A. Paterson
Mailto:d.paterson2@genie.geis.com

INTRODUCTION

This is a very basic version. I intend to add as people give
feedback to what they want to see, and how they want to see it.
Any info you have is more than welcome!

PURPOSE

This FAQ exists to describe the various hardware
modifications available to the Atari 8-bit user. It does not
teach you how to do them. It definitely doesn't take any
responsibility for the results if you do try them. But it will
try to give you some information about where to find more
information, which upgrades (or "hacks") are best, and who to
consult if things go wrong. For addresses and phone numbers of
any of the companies listed, consult the Vendors and Developers
List, posted at or about the 15th of each month.

It also exists to describe the many wild and wonderful products that have been produced for the Atari 8-bit. Many are unique, some may be apocryphal. Mainstream items like printers, modems, disk drives and cassette decks are all excluded. Temperature gauges, combination printer buffer/ramdisks that run through the joystick port, and other such are fair game.

POSTING FREQUENCY

This FAQ is posted whenever I remember to post it. It is posted to comp.sys.atari.8bit.

PART I - RAM Upgrades

General

The 6502 microprocessor at the heart of every Atari 8-bit has a sixteen bit wide address bus. What this means is that it can access up to 2^16 memory locations. That's 65536 bytes. Some people, wanting more memory, came up with a variety of techniques to use more memory. Most were built around the idea of bank switching. Bank switching means that you swap chunks of memory around so that the CPU can see them when necessary. Most schemes use 16k banks, though 4k and 32k have also been tried.

Atari 400

The original Atari 400 had either 8k or 16k. Atari produced a board with 48k. Mosaic produced a 32k board, as well as a 64k board with 48k RAM plus 4 4k RAM banks. (ANL 13, IFC)

Atari 800

The Atari 800 came with three memory slots. Each slot could contain Atari 8k or 16k RAM boards. Mosaic produced 32k and 64k boards. Three 64k boards could be combined for 192k.

Axlon produced the 128k RAMdisk board. It banks 16k, using $CFFF as a control register. Banked memory appears from $4000 to $7FFF.

David Byrd created the "800 PLUS 288K UPGRADE" which rewired existing 16k RAM boards, but required additional work to become fully Axlon compatible. A nasty sort of flame war erupted between David Byrd and Jay Torres of the Windhover Project over who invented the upgrade.

Magna systems produced 256k, 512k and 1M boards which followed the Axlon standard. (ANL 65, 68)

Atari 1200xl

See 800xl.

Atari 600xl

As shipped, the Atari 600xl came with 16k RAM. Atari released the 1064 memory module which expanded the 600xl to 64k. MPP, now Supra, produced the Microram 64k Memory Board (ANL 19, 28)

RC Systems produced three expansion modules for the 600xl, raising memory to 32k, 48k or 64k (ANL 26, 12)

Richard Gore produced the Yorky, a 256k board which plugs in to the PBI. It provides full compatibility with 130xe type banking. It is for use on 600xls upgraded internally to 64k, or on 800xls. (AC 3/2, 10)

Atari 800xl

The Atari 800xl came with 64k RAM internal. To access RAM hidden under the OS ROMs, the PIA chip was used (PORTB, used for STICK(2) and (3) on the original 800). Claus Bucholtz published plans for a 256k upgrade which banked 32k at a time using PORTB for control in Byte magazine. (Byte Sept 85)

ICD released the RAMBO upgrade, providing 256k in 16k banks, using PORTB. Newell came out with the 256k XL, which would work on a 1200xl or 800xl, providing 256k total memory, . The two upgrades used different sequences to access their banks. (ANL 44, 115)

Charles Bucholtz updated his upgrade to use 16k banks after the release of the 130xe. Most of the 800xl upgrades can be made compatible with Antic banking. The only possible problem would be when Antic and the CPU are supposed to be using different memory

banks.

The Yorky will also provide 256 on an 800xl (see the entry under 600xl).

Newell released 1Meg and 4Meg upgrades for the 800xl. These banked 16k as well, and required disabling internal BASIC to properly access the memory.

Fine Tooned Engineering, having bought the rights to ICD and Newell's products, is bringing out a third method in the Mars 8. Though not yet released, it will use SIMMs for 256k, 1Meg or 4Meg RAM.

Atari 130xe

The 130xe was the first "official" method of banking memory. It too used PORTB, but with an added twist: ANTIC and the CPU could access different banks. This provided headaches for some owners of "older" upgrades, but few programs took advantage of this feature (SpartaDos Wedge and VideoBlitz demo only). Upgrades for the 130xe include replacing one set of 64k chips with 256k chips, raising the RAM to 320k. Adding another 256k for 576k total has also been done. These were designed by Scott Peterson, as was a 1088k upgrade.

PART II - Video

Upgrades

The most common video upgrades are the SuperVideo series, described in AC 2/6. Plans were provided for the 600xl, 800xl, 1200xl and 130xe. The SuperVideo upgrade provides the forgotten chroma signal on the monitor port. It corrects a number of errors in the parts in the Atari video circuit, resulting in a clearer image, particularly on monitors.

Providing TTL output was also covered in AC 2/6. Bob Woolley provided plans for the circuit, as well as instructions for getting TTL output from an XEP80. Be warned that the output is not in the standard Atari colours; on a CGA type screen, the sixteen possible shades are translated into eight colours.

80 column devices

Since the 400/800 were released in 1979, people have been clamouring for better text displays than the default 40x24. Two products were released for the 800: The Austin-Franklin 80 column board and the Bit 3 80 column board were both for use in the Atari 800. They replaced the third memory module. The Austin-Franklin board came with a "Right Cartridge" which provided the drivers. Removing the cartridge disabled the board. Some software would not run with an 80-column board installed.

Ace 80/80xl was a cartridge released which provided 80 columns by using bitmapped graphics on an 80 column screen. A similar technique was used in the Newell Omniview, an add-on for their Omnimon.

Atari's entry into the 80 column field was the much maligned XEP80. For maximum compatibility, the XEP80 attaches to the computer via a joystick port. It includes three character sets, 8k internally, and a parallel printer port. The software provided by Atari supports a 320x200 graphics mode. This mode only supports direct bit images. Hacks have been released which hook the XEP80 on via the parallel bus.

Genlock

In October and November of 1991, Michael St Pierre published articles in the SLCC Journal describing plans for a monochrome Genlock. A genlock is a system to synchronize live video with a computer image. Graphics can be overlaid, faded in or out, or used for titling.

In 1994, Michael announced Prism Studio, a full colour genlock. It is sold by Mytek.

PART III - Operating Systems

Computer OS
-------- --

400/800 Rev A. No self test; Memo Pad mode.
Rev B. Fixes several bugs in Rev A.

1200xl XL OS. Some incompatibilities with 400/800 OS

600xl/800xl Revised XL OS. Includes parallel bus handlers. Internal BASIC.

65xe/130xe Revised XL OS. (as above)

xegs Modified XL OS. Self-test mode changed.
Internal Missile Command and BASIC.

Operating System upgrades

UltraSpeed + OS : from CSS. Supports high speed disk communication. Drives 1 through 9. Any RAM upgrade. Includes three modes: standard xl/xe OS; 400/800 OS; UltraSpeed+ OS. For XL/XE systems.

Omnimon: from Newell. M/l monitor for 400/800. Installs into $C000 page of memory, otherwise unused.

RAMROD OS: from Newell. Replacement for 400/800. Includes accelerated floating point math package.

RAMROD XL: from Newell. OS speed-up routines, fast math, and Omnimon. Includes option for second OS.

XL Boss: from Allen Macroware. OS replacement for XL model computers. Includes m/l monitor. 400/800 OS compatible.

TurBoss: available from KP and Best. Fast math and fast screen routines. For XL/XE computers.

PART IV - Other Neat Stuff

Zucchini

In ANL 59,60 and 62, Dr. Lee S. Brilliant provided plans and software to turn a surplus Atari into a printer buffer for another Atari. He called it "The Atari Zucchini".

The Printer Buffer Routine (PBR) and Disk Emulator Routine (DER) came from B.L. Enterprises. They were cartridges and cables which worked in a similar fashion to the Zucchini. The PBR provided a buffer, while the DER emulated a disk drive on the remote computer. Stock XLs gave 403 free sectors; a 130xe would give 914. (ANL 65, 67)

Voice Master

Covox sold the Voice Master and Voice Master junior. These would capture and record speech. Bundled software attempted recognition of commands, with limited success. (ANL 47, 44)

Parrot

The Parrot was a sound digitizer sold by Alpha Systems. Resembling a paddle, the device had phono jack for input. Antic provided plans for a similar project, called the Antic Sampling Processor. (ANT 8/8, 11)

SoundMouse

Among the more esoteric products ever released was the SoundMouse, which interpreted sound to provide a reading on a paddle register. It did not act as a digitizer, like the Voice Master and Parrot did.Bundled software made the lava lamp look mainstream in its appeal. No commercial applications taking advantage of this unique device were released.

Gumby

Chuck Steinman of DataQue created this set of plans for building stereo sound by installing a second Pokey chip (Pokey and Gumby, get it?). Once installed, the second channel has all its addresses 16 bytes higher in memory ($D210 - $D21F). A small number of demos have been released in stereo.
ftp://atari.archive.umich.edu/Atari/8bit/Sound/gumby.arc

PIA2

With the use of PORTB for RAM banking, hackers were looking for more parallel outputs. This plan, for adding one more PIA chip, includes notes for adding two more. It was intended as a means to control large RAM upgrades. (AIM 3/2, 16)

Critical Connection

A long time ago, in a galaxy far, far away, was a mystic operating system known as CPM. A company named USS Enterprises produced the Critical Connection, a device to permit a CPM computer to emulate disk drives for the Atari. It was a cable, plus software for the CPM end of the system. The CPM system could also act as a printer buffer, and the CPM keyboard could be used in the place of the Atari keyboard. (ANL 39,103)

SIO2PC

With the demise of CPM and the rise of the IMI cartel (IBM-Microsoft-Intel) a new system similar to the Critical Connection arose. Nick Kennedy developed the SIO2PC hardware and software, which permits any PC with a serial port to act as up to four disk drives for an Atari. It can also act as a printer buffer.

Computer Eyes

Computer Eyes was a video capture system which plugged into two joystick ports. It could render images in a variety of modes. It required a composite video source. (ANL 35, 53)

Easy Scan

Take a cartridge, add a fibre-optic cable, and hook it onto a printer, and you've got Easy-Scan, an image scanner for the Atari 8-bit. Innovative Concepts produced this item. (ANT 7/6, 43)

WIMA Radio, Lima, Ohio

This radio station, when automating 6 broadcast hours daily, created a hardware and software package built around a 130xe for control. Control was via joystick ports and tone decoders. (ANT 8/7, 30)

Comp-U-Temp

This provided 8 or 16 channels and 2 or 4 sensors. It would monitor the temperature, with options to log results to disk or printer, or to sound an alarm if the temperature strayed out of set boundaries. The software was described as "cumbersome". (ANL 48, 35)

Turbo 816

Released by DataQue, this provided a replacement OS as well as a replacement for the 6502 CPU. A 65816 was substituted, providing new opcodes and a 24 bit address space (16Megs vs 64k

with the 6502).

Sweet 16

Released by Fine Tooned Engineering, this provides a 65816 CPU to replace the 6502.

MIDIMATE

MIDI stands for Musical Instrument Digital Interface. It is a system for computers to record, replay and control musical instruments. MIDIMATE, when combined with MidiTrack software, permits an Atari 8-bit to take control. (ANL 33, 26)

MicroNet

Supra provided the Atari community with its first networking product. MicroNet provides nine SIO connectors. Eight are for computers. The ninth goes to whatever peripherals are to be connected. The system served to isolate the computers electrically. It did no software checking, meaning that two or more users attempting to print or save at the same time could trash each others output. (ANL 51, 76)

MultiPlexer

CSS provided a better way to network. The Multiplexer system requires one host system which has all the disk drives and printers for the network. The slaves are connected via the cartridge port to the host, and all their disk and printer i/o is rerouted to the host. All the systems involved require their OS replaced with a special multiplexer OS.

MIO

ICD manufactured this wonderboard in 1987. Connected to the PBI or ECI, it provided either 256k or 1Meg of RAM, two RS232 ports, a parallel printer port and a SCSI hard drive port.

MIO II

Currently under development by Fine Tooned Engineering, this PBI/ECI board will provide an interface and power supply for an IDE hard disk. It may also include extended memory support for CPU upgraded computers, as well as a parallel port.

Black Box

CSS manufactures the Black Box, a PBI/ECI device that offers an optional 64k printer buffer. Its main attractions are its m/l monitor, 19200 baud RS232 port, parallel port, and hard disk interface. The parallel and serial ports do not use standard DB9 or DB25 connectors; custom cables are required.

Floppy Board

This is an add-on to the Black Box, also from CSS. It permits standard floppy drives, 360k, 720k, 1.2M and 1.44M, to be attached to the Black Box. Since they are connected to the PBI, these drives operate extremely quickly.

Supra/KP Hard Disk Interface

Supra released one of the first hard drives for the 800xl. It hooked up via the PBI. KP bought the rights to the interface from Supra.

R-Time 8

This is a clock cartridge for any Atari from Fine Tooned Engineering. It includes a pass-through connector so that any other cartridge can be plugged in as well. Though primarily intended for SpartaDos, software for other DOSes is included.

Mars-8

This is still under development from Fine Tooned Engineering. For 800xls only. Memory expansion of 256k, 1M or 4M. Install internally Action, Basic XL/XE, MAC/65, SpartaDos X, R-Time 8.

Atari 850

This device hooks into the SIO line, and provides 4 9-pin RS232 ports and a 15-pin parallel port. The RS232 ports are NOT IBM PC standard. The MIO and PR Connection use the same pinout.

P:R: Connection

This device plugs into the SIO line, and provides 2 9-pin RS232 ports and a 15-pin parallel port. It is powered by the SIO line. The Atari 1200xl requires an internal modification to work with this device, or with the Atari XM301 300 baud modem.

Voice Box II

Manufactured by the ALIEN Group, this speech synthesizer even nade it into TIME Magazine in their "Machine of the Year" issue in 1982. Plugging into the SIO line, this device would produce speech of the traditional computer variety.

R/128 RAMdisk Printer Buffer Spooler

Protronics of California announced this 128k RAMdisk/printer buffer which interfaced via the joystick ports, offering it as a replacement for the 850. A 512k upgrade was promised. (ANT 2/8, 106)

N1858-32

Newell Industries announced this 850 replacement in 1983. It offered two serial and one parallel port, along with an expandable 8k printer buffer. (ANT 2/8, 106)

Oscar Model 1

This bar-code scanner was from the Databar Corp. The intent
was to permit the speedy entry of computer programs which would be
encoded in magazines. (ANT 2/8, 107)

1200XL PBI

Hackers love the 1200xl for two reasons: because of all the
space available within the case, and because of the great
keyboard. Bob Woolley came up with this set of plans for adding a
parallel bus interface to the 1200xl.
ftp://atari.archive.umich.edu/Atari/8bit/Modifications/pbi1200.arc

: I know, this was not my point though.
: Well a few ns here and there, what could that be against 1050 arm movement?
: :-)

Actually, FYI the 'arm movement' takes place after the first and most
time critical ACK. If you miss the first ACK, everything gets desynched
and you lose at least one command frame.

: >the next few months> 16550 support may not help the problem. Thing is,

: Who said sio2pc had 16550 support?
: And OS/2's multitasking is highly configurable, of the box, I'd say
: it will be hard, but with a little bit of tweeking.....

After the first ACK, the Atari will wait a VERY long time for the data returned
by the device. Missing that ACK is what causes the timeouts, etc. I
think running TX interrupts will help this.

: >right now the SIO2PC hardware is tied to the ring indicator which as far

If rick is willing to build a sio2pc device that uses another line I
would be happy to send a version os APE that supports it.

Whew! That's a relief.

>But for a PC/DOS program intended to run on a PC at 39.99 I guess I may
>have views on that. (That's what I paid for OS/2 Warp here)

I'm not asking you to shut up - I'm asking you not to beat the poor guy over
the head with a stick until updates come out.

Not many people bother with Atari anymore - and I won't stand by and watch
someone who writes a great piece of software get thrashed for his trouble.

Congrats on the lowball price for OS/2 - most of us paid retail.

>FYI OS/2 contained Word-processing/Scren blanker/Dos emulation/Windows
> integration/ etc. however no Atari 1050 emulation, perhaps something for
>OS/2 Klingon.

No need to be insulting. I know what OS/2 Warp comes with - I'm writing on
it now.

And you are also correct in that 1050 support has never been in OS/2;
not in 2.0, or the three 2.1 beta's I participated in, or in 2.1 (or the 2.1 Service
Pak), or in Warp. I went back to my library of Beta CD's to check.

>-supports single IDE-Harddisks 'till 504 meg a this time (but we'll working
> on a LBA-mode and master/slave solution - a question of software only)

Up to 504 MB? At one time? It is interesting, because, as you said below,
there will be only 8 partitions 16 MB each (= 128 MB). Or perhaps your
software can handle a disk up to 504 MB, but generally the disk size is
limited by the DOS to 128 MB. If so, why 504 MB ONLY?

>- we have no exact speed figures (they will follow), but you have DISKRX (
> diskmonitor by SPARTADOS) with over 32kBytes up in ca. 4 seconds !!!

So it is rather slow, isn't it? 32 KB per 4 seconds = 8 KB per second.
For me, such speed is incredible. Always thought, that such routine cannot
be slower, than 14 KB per second (because my first, very primitive routine
had such a speed).

2570. Re: Atari 8-Bit Hard Disk Systems

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-06 00:00:00 UTC
From: Jason Hedrick <102416.675@CompuServe.COM>
Message-ID: <42l4jdhjp1@mhade.production.compuserve.com>
Source record: 88692

John,
When ICD supported the Atari 8-bit computers, they produced a thing called the MIO, or Multi Input Output (I think). It had built in extra RAM for a Ramdisk, Serial and Parallel ports and a SCSI port for Hard Drives. I've heard that it is not reliable, but know of a couple of people who own them, and have no complaints. ICD's 8-bit product line was sold to Fine Tooned Engineering. The owner's name is Mike Hohman his Internet address is F.TOONED@genie.geis.com (I think).
The other available option is the Black Box by Computer Software Services, (CSS) owned by Bob Puff. I'll quote directly from the catalog for a brief description of the Black Box.
The Black Box is and add-on board for the Atari 600XL (64kb), 800XL, and 130XE computers. It is a T-shaped board that plugs into the PBI port of the XL computer, or the ECI and cartridge ports of the 130XE. Connectors for both types of computers are built into the Black Box, so no adaptor boards are n necessary. A cartridge port is available on the board itself for 130XE users, since the board plugs into the cartridge port. The board is 12 inches wide and 3 inches deep, sitting back 3 inches from your computer. It has two switches, two push-buttons, and a set of DIP switches on the top.
The Black Box provides many unique and useful functions. The four primary functions are:
RS-232 serial modem port
Parallel printer port
SASI/SCSI hard disk port
Operating system enhancements
END QUOTE.
I own neither of these, but given the choice, it will be the Black Box. Not only does the Black Box do all that stuff, it does a LOT more. Also available is a floppy board add-on that allows you to hook up industry standard IBM compatable floppy drives. (5 (scratch that.) (5 1/4 " and 3.5" 1.2 Mb and 1.44 Mb, respectively, and the 8 inch floppies.) It also does a host of other stuff. I hope this has been helpful. Here's Computer Software Services' address and phone number. By the way, they now answer the phone, "New life electronics...". I don't know why. I haven't asked. But it's the same place, and the same stuff...

Computer Software Services
P.O. Box 17660
Rochester, New York 14617
Phone:(716) 429-5639
FAX:(716) 247-7158

Before your current system goes "kaput", you should start visiting the local thrift stores. Before long, you should be able to aquire some extra Atari disk drives & computers so you will never have to worry about the day arriving when you will be forced to buy a computer that gets Bill Gates official seal of approval.

It is worth noting that the prices of Atari computers at some thrift stores are quite good. An Atari 800 system that originally cost over $1,000 can be sometimes had for as little as $10. Not long ago I purchased 50 disks of original Atari 8bit commercial software for $7. No docs and some of the disks didn't run but for $7 it was still a good deal.

Hmm... maybe the time has come for me to get such an animal too.
What's the price of it? And, btw, does it _add_ 256 KB (which gives
your machine 320KB) or does it _expand_to_ 256 KB ?

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <145057@cup.portal.com>
Source record: 88695

My son got it to run under OS/2, but only in a full DOS window with something like 98% of multitasking pointed at it, I'd have to double check with him.
IMO: As you stated, some of the info that's important will either be found in the OS listing or DOS source code, but it may not be what we expected at first. I think what happens is the first thing DOS/OS does when it looks at a drive is send a SIO STATUS request regardless of what the real operation is going to be. This makes sense, because of things like moving the head the time out values are set to nothing<well, I should look them up> for the status

request & if the drive doesn't respond the DOS/OS doesn't waste a and a few seconds for all the other commands. I think the longest time out is for things like disk format, quickest is status. It's not that hard to check, we could do our own SIO status requests with various time outs to see if it's a problem.
Rick

2574. Re: Weekly Posting of New: aka what is APE

Steve, I'll get on it but as you know I'm a little more then slow about getting stuff out. As I think about it, what would really

make sense is just a simple jumper block that reroutes the Atari CMD line to a different IBM input. That way it would be usable with all versions of the software.

> Rich: A huge problem with getting the XF551 to read more then 256 byte
> sectors is it only has the on board 256 bytes of ram in the 8032/8052

(SNIP)

>
>>>>
Okay, Bob Puff installed a RAM, size unknown to me, to handlle
the 512 Byte sectors. I guess what I would have to add a 32K RAM to do the
same thing for a 1.44 Meg floppy. The RAM would hold one complete Track
(1024 x 18 sectors). Would even support 20 sectors/track I use this on my
STe and FALCON so long as I'm not going to be using them on a PC.
OOPS! That should be 32K by 8 RAM.
For me the problem would be the software (SDX & MyDOS support)
and the Firmware (XF551 Micro Code). I do have access to a PROM
Burner, DATAIO model 29B. I also hate to reverse engineer software
especially when it's already been done.

Anymore Ideas, Comments? Please!

Rich Mier

2576. Uploaded: Atari 800 Emulator for Unix + Amiga

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-06 00:00:00 UTC
From: David Firth <david@signus.demon.co.uk>
Message-ID: <1995Sep6.225100.937@signus.demon.co.uk>
Source record: 88698
Cross-posted to: comp.sys.atari.8bit,comp.emulators.misc

I have just uploaded the latest version (0.1.9) of my Atari 800
Emulator for Unix and CBM Amigas + AGA chipset.

If can be obtained via ftp from:-

ftp.demon.co.uk (158.152.1.44) in /pub/emulators

Changes in 0.1.9

- Corrected bug in IRQST and IRQEN
- Corrected minor bug in player missile collision detection
- Amiga version is now full screen + Menus
- Faster disk I/O
- Added ATARI800 environment variable. This allows the emulator to be
run from different directories. If ATARI800 is unset it will still
try to load the OS images from object/ below the current working
directory.
- colours.h replaces colours.dat
- Added man page.
- New way of handling Joysticks, Triggers, Paddles and Console Keys
- Corrected handling of CHBASE which was causing K-RAZY ANTIKS to
display garbage.
- Corrected handling of VCOUNT which was causing screen handling
errors in Star Raiders (galactic map) and Henri (game screen).
- Added Sound API. A test sound implementation is available for
the Linux SVGALIB version via /dev/sequencer - It's not very good
and has only been used to test the API. It is enabled by starting
the program with the -sound option. Listen to the title screens
of Necromancer, K-Razy Antiks and Henri (these are the best
I've heard).
- argc and argv are passed to the platform specific initialisation
code - Atari_Initialise(). This allows platform specific options
like -sound on the Linux SVGALIB version.
- Extra Amiga options -ocs -ecs and -aga. Currently the default is
AGA. The -ocs and -ecs have been tested on an A1200 with the
OCS and ECS emulation modes enabled. At the moment it is not
guaranteed to work on real OCS or ECS equiped machines since it
has only been tested under Workbench 3.0. Hopefully someone will
provide some feedback.
- Another two Amiga options -grey and -colour. The -grey option
produces a grey scale display on OCS, ECS and AGA machines. The
-colour option produces a full colour display on AGA machines and
up to 32 simultaneous colours on OCS and ECS machines.

- The DOUBLE_SIZE compilation flag for the X11 version has been replaced by a runtime options. The runtime options are -small, -large and -huge.

Bye for now

David Firth <david@signus.demon.co.uk>

2577. APE 1.06 Now Available

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-06 00:00:00 UTC
From: stucker@nyx10.cs.du.edu
Message-ID: <42lamv$oo0@nyx10.cs.du.edu>
Source record: 88699

Thanks to everyone for thier messages of support. I have decided
to make APE 1.06 available, and I will be uploading it to archive.umich.edu
and James King's ftp.xmission.com archive later tonight.

As always, if you cannot locate APE at one of these sites as
APE106D.ZIP, please feel free to e-mail me and I willbe happy to send
you a UUENCODED copy of the archive. Please send e-mail to classics@nacs.net

Here is a small summary of APE and the changes since v 1.04, as taken from
the 100k APE Users Manual.

9/2/95 Added of improved since APE 1.04:

* Titles added to file selector
* TAB can now be used to edit file selector path/filespec
* Misc HELP screen fixes
* Found memory leak in load disk image routine, fixed.
* Added first Diskcomm3 -> ATR conversion code
* DCM -> ATR converter now part of APE program, option [A]
* DCM -> ATR converter can now handle batch processing
using wildcards
* DCM -> ATR converter now asks if you want to mount the
image you just converted (if you convert only 1 image).
* Integrated new COMM routines, speed and reliability improved
* Verified HAPPY HS I/O w/ Diskcomm3, ok.
* Verified Ultraspeed I/O w/ Bitter Reality Demo, ok.
* APE now rejects corrupt/invalid ATR files
* HAPPY SECTOR COPY from the Happy System Disk verified to
work ok.
* Bug in Happy write routine found and fixed.
* Bug in computation of high sector numbers found and
squashed. Nobody complained about this, anyone out
there? :)
* Added UART/COMM configuration screen and code, now available
in [Z] Configuration, [4] Option 4.
* UART/COM settings now saved in APE.CFG
* Eliminated '.' from file selector, useless entry and its now
easier to navigate using the browser.
* Added '>' and '<' commands to traverse directory tree, as
requested for spartados users.
* PC Mirror updated to work a 2x speed w/ Happy HS I/O

** PC Mirror now compatible with Spartados. Can now copy files
of any size from the PC mirror into spartados using COPY,
XCOPY, etc. Spartados still has a bug in its i/o routine
but i found a way around it.

* Happy HS I/O writes were still causing jumps to ultraspeed
on occasion. Found a problem in the timing code and its
now a very solid routine.
* XF551 high speed I/O didnt work most of the time, again nobody
reported this monster bug. Fixed and verified with XFTOOLS.ZIP.

* Much of APE recoded and optimized. Many sections were in
the orignal beta 'just make it work' form and were real
electronic elephants. A few sections of non time-critical
repetitive code centralized. Code and data segment sizes reduced
signifigantly and program speed increased.

* Started recoding I/O routines for 3x SIO.
* Recoding of 3x SIO routines finished.
* Patched WARP.COM to allow 3x SIO speed, now renamed to
APE_WARP.COM to avoid confision. Verified reads and writes
with MyDOS 4.53.

** Added support for 3x SIO speed using Spartados 3.2g with
NO DRIVER REQUIRED. Spartados now boots in APE+ (3x SIO)
mode automatically.

* 'Force' in the help screed was spelled 'Forse', duh.
* Added Spartados Configuration Menu (Cfg [Z] Option [5]) to
allow selection of default Spartados speed for very slow
PC machines that cannot handle 3x SIO.
* 3x SIO verified NOT to work with Spartados versions 3.2d and
earlier. Spartados SIO routines in these versions cannot
keep up with APE+ SIO and get choppy.
* Cursor turned off, guess it annoyed some folks just sitting there
and blinking.
* Added 'APE+' display to indicate 3x sio running.
* APE+ SIO (3x) verified to work w/ 3.2g in single and double
density.
* APE+ SIO (3x) verified to work at 3x speed w/ bitter reality
demo. Any program that follows the Spartados model should
work w/ APE+ IO.
* APE+ SIO (3x) verified to work with MyCOPIER at 3x SIO speed.
* APE+ SIO (3x) verified to work w/ Diskcomm3

** Added support for 'simple' PROTECTED DISK images. Protection
information is stored in a 1k file of the same name with
the extension '.PRO'. Sample disk images:

APPLE.ATR/PRO - Apple Bandits protected version
SPY.ATR/PRO - Spy vs Spy protected version

* Fixed a bug in the DCM->ATR conversion code, leftover
junk from the standalone version eliminated.

* Fixed PC MIRROR to allow APE+ (3x) sio access.

* Screen blanker added, now blanks screen after 2 minutes of
keyboard and SIO inactivity.

* Ultraspeed timing tightened, better performance.

[The following code is complete, but is not included in APE 1.06
because without the ability to use the READ/WRITE TRACK commands
properly, they are not really useful except for show. When I
get a Happy/Archiver drive to test with, these may be included]

* Happy Controller Ram emulated.
* HAPPY System Disk now recognizes APE as HAPPY w/ Controller
Option installed.
* Happy Tracer Buffer emulated. HAPPY system disk now recognizes
its presence and displays it contents.
* Happy code buffer emulated and high speed transfers
working. Able to completely load 'BACKUP ANY DISK' and
accept drive programming.
* Happy move head command recognized
* Archiver READ TRACK command recognized, only response figured
out so far indicates a totally empty track.
* Archiver FORMAT TRACK command accepted.

And finally a small summary of APE taken from the Users Manual:

WHAT IS APE?

APE is an advanced serial application capable of emulating
an entire subsystem of devices on the Atari 8 Bit SIO bus.

WHAT HARDWARE IS REQUIRED?

APE talks to the SIO bus of your Atari 8 bit home computer using
an SIO2PC compatible serial cable. This serial device provides
the hardware required to convert the voltage levels present on
the Atari SIO bus to levels compatible with the PC serial port.

This device hooks directly to the SIO port of your atari computer,
and to the serial port of your PC compatible computer. No
interface or other additional hardware is required!

WHAT SIO HARDWARE DOES APE EMULATE?

The following SIO hardware and command systems are supported:

* Full cooperation with REAL sio devices, such as disk drives.

* Special APE+ 3x SIO mode! 1.5x faster than Happy Warp Speed
and US DOUBLER Ultraspeed. Functions transparently under
Spartados, no patch or loader required!

* SpartaDOS ULTRASPEED I/O in any drive/density
* Upto 8 Diskette Drives
* Single, Double and 1050 Enhanced Density for any drive
* Disk images of upto 16 megabytes in size!

* PC MIRROR drive gives access to files on your PC hard drive with
any dos and at all SIO speeds, including APE+ 3X SIO!

* REGISTERED users may now WRITE files to the PC mirror, making
file transfers to your PC as easy as using the
DOS Copy command

* Emulation of some PROTECTED disk images.

* Emulation of the Atari 850 interface, allowing you to use
your PC modem and printer from any atari application that
can use the 850 interface. 100% 850 stage 1 compliant.
* Hardware flow control for the PC modem using the R: device.

* Basic SIO Commands Supported
- Read Sector
- Write Sector
- Put Sector
- Disk Drive Status
- Controller Format Diskette
- Controller Format Enhanced Density Diskette
- Read Percom Extended drive configuration block
- Write Percom Extended drive configuration block
- Get 'Speed Byte'
- Ultraspeed I/O Sector Skew Format Diskette
- Print to 850 interface

* XF551 High Speed Read Sector
* XF551 High Speed Put Sector
* XF551 High Speed Write Sector
* Happy Warp Speed Read Sector
* Happy Warp Speed Put Sector
* Happy Warp Speed Write Sector
* Happy 'Are You Happy?' Command
* Happy Read Status Command
* Happy Format Diskette
* Happy Init Controller
* Happy Reset Drive
* Happy Set Unhappy Command
* Happy Set Fast Write
* Happy Force Protect
* Happy Force Write

[Extended Happy Stuff]
* Happy Tracer Data
* Happy Controller Option RAM
* Happy Drive Program Area

WHY USE APE?

Buying or building this interface, and purchasing the REGISTERED
version of APE will be one of the the best investments you can
possibly make in your Atari computer.

THE PRICE FACTOR

For less than the price of a SINGLE 'refurbished' 1050 disk drive from one of the few remaining atari 8 bit dealers you will receive all the following:

a) Emulation of 8 disk drives, each of which may hold a disk image of upto 16 MEGABYTES. Thats 128 megabytes of information and programs at your fingertips at all times!

b) Each emulated disk drive is also capable of emulating the Spartados US Doubler ULTRASPEED (2x), XF551 Warp Speed I/O (2x), Happy Warp Speed I/O (2x), APE+ Warp Speed I/O (3x).

This enables your disk access to be more than three times as fast as a standard 1050 disk drive using Spartados, Happy Warp Speed Dos, Mydos, and other high speed operating/dos systems and copy programs or just ANY dos using the Happy Warp Speed OS patch.

c) Using APE is like having a hard drive equal to that of your PC on your Atari, and for a SMALL FRACTION of what a similar system would cost for your 8 bit. APE also preserves the value of your existing PC hardware by making it available to use on your Atari also.

Ape does ** NOT ** erase and reuse your PC hard disks, it stores data in 'disk images'. Disk images are regular PC files (like this one) that mimic the size and format of a real Atari disk. They may be as small as 90k, the size of a Single Sided/Single Density 810 disk. And as large 16 megabytes, 65,535 DOUBLE DENSITY SECTORS.

If you previously used the software 'SIO2PC', your old SIO2PC disk images are 100% compatible with APE. APE itself creates images that are backward compatible with the SIO2PC .ATR format.

d) Transparent access to your PC printer from any atari 8 bit application, without the use of any special atari software. APE intercepts and replies to all SIO commands sent to the P: (printer) device and passes that data on to your PC printer. APE also is capable of preforming translations of this data on the fly to match the specifications of your PC printer!

e) Direct access to any file on your pc hard drive, from your Atari using the powerful PC MIRROR function. Transfer files to and from your MSDOS filesystem using only your Atari Dos copy function! No other software can offer this revolutionary feature!

f) Transparent access to your PC *MODEM* from most any Atari terminal program that is compatible with the Atari 850

interface! APE responds to stage 1 calls for the 850 interface R: (modem) handler, making it virtually 100% compatible with most terminal programs.

APE continues to provide access to your disk drives even when running in concurrent i/o. This allows you to do things such as run a BBS, download files, etc all without having ANY real atari disk drives or modems attached to your computer! (or wallet :)

The registered version of APE provides automatic HARDWARE flow control, allowing you to access modems transmitting data faster that 19.2k.

Note: Concurrent I/O is the special serial bus mode the atari uses to communicate with the 850 interface, modems and other streaming serial devices.

g) Reliability. You will never fear your data being lost to a bad floppy disk. Your files and data will rest in file on your PC hard drive, and can be backed up to a PC tape drive, etc. The same as your other valuable PC data.

And MUCH MORE! Read on to discover all the powerful features of APE.

Idea, but not a heck of a lot of help probably. You could see if you
can find Wooley's article. He lists the bytes/offsets for making the
5.25" to 3.5" upgrade. It will still mean you have to figure out a heck
of a lot, but it's a starting point. I don't think I even know somebody
that knows how to write 8050 code let alone disassemble & figure it out.
There's a couple of dozen outfits that sell 8050 disasemblers, but they
want something like $50 which is a little high for a one time project.
Rick

>$1,000 can be sometimes had for as little as $10. Not long ago I
>purchased 50 disks of original Atari 8bit commercial software for $7.

That's good advice. In previous years, I have focused on the
breadth of my system - that is, I tried to acquire as many /different/
items as possible. While there is some overlap (ie, I have three Atari
800's), mostly I have lots and lots of different items.
Now, though, I'm concentrating on system depth. I'm attempting
to get a reasonable number of backups of the items I use most frequently.
That will provide a number of additional years of usefulness.
Still, there will be some point at which I won't be able to use
the 8-bit anymore. That'll be a sad day, indeed. Until then, I'll be
thumbing my nose at Bill Gates. :)

* Hmmm, somewhere in a parallel universe, Atari 2600's
* were packaged with a small sample of dog food and a
* copy of Chase the Chuckwagon, and Combat was
* a promotional cart you got for saving the UPC codes
* off of six AK-47's
***************

Did you ever want to play those 8-bit Atari Carts in style, well the
XE Game System is for you. It was Atari's last ditch effort to
market their 8-bit computer technology for game use. It comes
with a detachable keyboard (not normally needed for most cart
games), and is the same kind of gray color as the Atari ST
computer line. Quite nice looking and really compact. On the back
it has the same drive cable slot of all the Atari 8-bit systems, a RF
output for your TV, and composite and audio outs for a
composite monitor. It comes with power supply and two high quality
Wico joysticks. All for only $45 + $7 shipping. For $5 more add the
following cart games: Asteroids, Pac Man, Missile Command and Centipede.
30 day warranty included.

2586. FS: 800 system

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-07 00:00:00 UTC
From: mjr1769@tntech.edu
Message-ID: <1995Sep7.213252.14227@atlas.tntech.edu>
Source record: 88611

All of this goes together,it's a package deal!
For Sale:

Atari 800 w/48K
Atari 410 cassette drive
Atari 1050 disk drive
Commodore 1702 color monitor
Panasonic KX-P1090 printer (80 column,dot matrix,does graphics,
tractor or friction feed)
Ape-Face XLP printer interface (RS-232)

Atari- Atariwriter (cart)
BASIC (cart)
Basketball (cart)
States and Capitals (cass)
Conversational Spanish (cass)
Sublogic- Flight Simulator II (disk)
Koala- Micro Illustrator (disk)
WITH Koalapad touch tablet
Antic(APX Classics)- RAMbrandt ver. 2.0 (Compatible with touch
tablet or joystick, converts MicroIllustrator
files. Also prints files.
All of the above are in original boxes with documentation,
except the 800 and 410, which don't have the original box.
All of this equipment is in good shape. Of course, all cables and power
supplies are included.

You pay shipping. Make me an offer on this system!

MJR1769@gemini.tntech.edu

2587. building an 850, possible?

Newsgroup: comp.sys.atari.8bit

Yeah, I don't know how IRQ's are treated under OS/2, however if
you could have a small, efficient, assembler IRQ handler that just
ACK's and perhaps raises APE-priority in OS/2 It would be very doable.
(Without switching task first)
(This is how you implement efficient multitasking in ADA83 running on
ex. 68000 processors)

Well, now it turns into a native OS/2 app soon.. :-)

2593. Q: RAMDISK Programming

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-08 00:00:00 UTC
From: apatpgpauman@apa.apa.co.at
Message-ID: <42p01r$44a@news.Austria.EU.net>
Source record: 88615

Hi everybody !

Can anyone help me in finding out
how the RAMDISK upgrades are integrating
their memory into the computer?

I know how the 130XE works because it's
described in the manual (PORTB of PIA).

But how do other upgrades (like the 4MB
from ICD or Mars8) work ? As I calculated
this, you need 7 bits to access 4MB in a
32K window (which won't suite into the
PORTB of PIA because 3 bits are used by
ROM, Selftest and BASIC) and it wont't
be compatible with 130XE because
ANTIC and CPU can't access different pages,
right?

Anyone out there who digged out some information?
Please let me know,

Thanx, mario

I have a 256K MIO, and I'm sure some others reading this newsgroup have
them. There is only one RS232 port; the "80 column" port would have
required an additional board, which was never produced. The 80-column
port and the serial port are identical-looking side-by-side 9-pin
connectors, so the confusion is understandable. ICD chose to use
Atari-standard printer and serial connectors and an IBM-standard monitor
connector.

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $100.00 or best offer.

ATR8000 64K CP/M computer, for use with Atari 8-bit computers or Dumb (IBM computer) terminals. Runs all CP/M 2.2 software, supports up to 4 disk drives, any size, any density, 8 inch, High Denisty 5.25 and 3.5 floppies, any IBM compatible printer, modem port for using any RS232C compatible external modem, includes Auto-Term Disk for Atari computers, CP/M 2.2 Master Diskette, several CP/M disks, ATR8000 Manual, MY-DOS master Disk, CP/M Supplement Manual, modem cable, printer cable, original cost $695.00 for the ATR8000 Basic system, printer cable $39.95, Modem cable $39.95, asking $125.00.

Dual Floppy Disk Drives in case with power supply and cooling fan, connecting cable, for above ATR8000 or any IBM compatible computer. Case can hold 4 half height 5.25 floppies, original cost $895.00, Case alone is worth $89.95 at most supply companies, asking $85.00.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes manual, power supply, DOS 3.0 master disk and manual, as well as DOS 2.5 Master Disk, original cost $179.95, DOS 2.5 cost $25.00, asking $100.00.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $250.00 for the entire package.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific programs, already wired for Turbo-816 installation, just need to re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the

256K DRAMs, asking $125.00.

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Send all inquiries/offers to: admiral@freebbs.com via Internet E-Mail,
or E-Mail reply to this, all serious offers will be considered! Will
also consider trading for IBM computer (80386SX at least).

ICD didn't do a RAM upgrade past 256K, the RAMbo XL.
Newell did the 1 Meg and 4 Meg. As for the 4 Meg, it is NOT
compatitble with most software except BBS software. They all use
the PIA Port B, some slightly differently. Just more added logic to
determine if the CPU should be addressing Banked RAM or OS
RAM or BASIC or whatever. Oh yes, Scott Petterson did do a 576k
and 1 Meg. At one time I drew it all out but I have no idea what
I did with the schematic.

The Mars8 is new and not out yet but I think it relies
on changing the 6502 for a 65816.

1) Any program written for the xm301 or the 1030, such as 1030
Express.
2) Any program that can use different serial drivers rather than
having the modem code built in. This includes all the modern
programs that I'm aware of.

I believe Bobterm comes with a driver for the xm301.

2602. Re: Comparing Atari Graphix (8-bit, 7800, 5200, etc)

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-08 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <42oltg$1hg@nic-nac.CSU.net>
Source record: 88624

I believe the 400/800/XL/XE and the 5200 have identical graphics capabilities, although I'm not sure that the 5200 supports GTIA modes (80x192x16/80x192x9).

The 7800 has much nicer (at least it sounds like it, I've yet to play a 7800 :( ) graphics, and not only has DLIs, but "DLI's *within* DLI's"..

So for example, one can change the color of the screen at some point down the screen on the XL, but one can also change the color of the screen at some point ACROSS it on the 7800.

At least this is what I think I remember hearing long ago - nobody quote me on this. :) Was I close to correct?

2607. Comparing Graphics 400/800, 5200, 7800

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-08 00:00:00 UTC
From: DM9200@mm.appstate.edu
Message-ID: <42pudm$4e2@lester.appstate.edu>
Source record: 88629

I had a 7800 and it appeared neither better nor worse than the 8bit computers graphics-wise.

Atari could have saved themselves two failed systems if they had scrapped the 5200 and 7800 from the get-go in favor of an XE game system style system using the 8bit carts.

Imagine, a substantial base of software from the introduction, near zero R&D because all they'd've needed was a shell for a stripped down 400, and a pre-existing user base among the 400/800 users.

Those dumb a$$es. I shoulda run things. ;)

2608. Re: building an 850, possible?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-08 00:00:00 UTC
From: lamcw@aston.ac.uk
Message-ID: <DEL091.FEH@aston.ac.uk>
Source record: 88630

```
;Anyone know of schematics to build an 850 from scratch?
;This might make alot of new Rainbow users, etc. pretty happy...

I believe it may be possible to build a RS232 type device and
plug it into one of the joystick ports. If that isn't tough
enough, you then have to write the software, probably in
assembler.
```

2609. 6502/6507 data sheets?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-08 00:00:00 UTC
From: classics@nacs.net
Message-ID: <42r30r$5io@seka.nacs.net>
Source record: 88631

I need to find technical information on the 65(c?)02 processer used in
the computer series, and very much need information on the 6507, which
I believe was used in the Atari 2600.

Im specifically seeking the number of machine cycles each flavor of
each instruction requires to execute on each of these processors.

Also, even if ya dont know this stuff here is something im sure someone
here knows:

When using the BIT instruction, are the N, V and Z flags set off of
the Accumulator, Memory or the byte that resulted from the 'invisible' AND?

The 2 books I have on 6502 machine language are really vauge about this, one
even says just to avoid the instruction ;)

Also, does BRK *ALWAYS* vector through the address in $FFFE/F no matter
what type of machine the 6502 is installed in?

Thanks

Steve

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: The 7800 has much nicer (at least it sounds like it, I've yet to play
: a 7800 :( ) graphics, and not only has DLIs, but "DLI's *within* DLI's"..

sort of. from my fuzzy memory, there's a horizontal display list
that fills up a buffer for display on the next scanline. i don't
believe that interrupts are generated for horizontal activity; the
beastie is basically DMA limited (certain number of stamps/line) and
you don't necessarily want the CPU to steal *more* cycles.

there seemed to be enough memory bandwidth to bitmap the screen (in
hires) a little more than twice. of course, this exceeded the amount
of memory in the unit, but with a stamp-like architecture this is
really the point.

: So for example, one can change the color of the screen at some point
: down the screen on the XL, but one can also change the color of the
: screen at some point ACROSS it on the 7800.

you can do this on a 400/800, too. you just have to be *real*
careful about the refresh counts, or mask the jitter with a foreground
object (this is SOP on some Sega h/w due to some chip-level bugs, i
have read...).

I don't think we should laf at what we think are high prices. Probably
the prices will not bring offers, but it supports the value of our own
stuff. I'm glad somebody thinks this stuff is worth so much. I remember
someone who wanted, like, $10 for single issues of Antic. It was
interesting, somebody else thought they must be real rare colletor's
items.

Steve; Number of cycles is a little long, something like 156 op codes
depending on mode i.e. LDA $1000 vs LDA $00 vs LDA $30. I believe there's
also a problem with # of cycles changing if a page is cross, i.e.
$600 BNE $610 ;Takes 2 cycles
$600 BNE $5F0;Takes 3 cycles.
So really, you don't know, can't know, how many cycles your code will
use until after you've assembled it & find out if you're crossing page
boundries. I don't have the instruction cycles in electric form, but
it's only a page or two in most books, like p374-375 in Zaks, I'll make
a copy for you.
The BRK instruction always jumps through $FFFE-F, in the Atari this is
a vector that points to the vector table on page two<?>. On power up
it just points to a routine that clears up the stack/RTI. As John Harris
and a few other said, the 6502 series has a hardware glitch which allows
the BRK instruction to fail on ocassion.
I don't use the BIT operator myself, but my understanding is it operates
on the A reg & memory but the only status register is affected. This is
to different from the other logical operators in that the results aren't
deposited in the A reg.
LDA #0
STA $600
LDA #1
AND $600
A REG now set to zero & n & v flags set
LDA #0
STA $600
LDA #1
BIT $600
A REG still set to one & z flag set. Whoops! I meant Z flag vs V above!
The status bits, n & v, are set directly from the memory location. I never
really thought about it, but for doing stuff like determining string length
on an Atari where the CR=>155, I guess this would be a good instruction to
use since it doesn't modify the bytes being examined. Ditto for string
compares.
The 6507s were used by Atari EVERYWHERE! The VCS, the 810 & 1050, the
850. They must of really loved that chip. I've seen some, IMO; odd
source code out of Atari that was targeted for the 6507. As I recall, it
was writen like it was targeted for a 6502 with the low memory references
in the 6507 addressing range, but the ROM in the $FXXX region. Been a while
so I could be wrong, but I remember thinking at the time, "It must be they
are testing it on [6502, 6502 emulator] or the 6507 will just ignore the
upper address bits. That is assembling a ROM with the address range
of $F000-$FFFF has the same effect of $7000-$7FFF since the address

lines are not brought out.

2616. FS/T: Classic computer games and systems [09/09/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-09 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <42rphp$m46@ixnews2.ix.netcom.com>
Source record: 88638
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy,comp.sys.ti

NOTE
This list now includes cartridge based software, as well as hardware.

updated 09/09/95

I have the following Classic computer equipment for sale or trade.
The list includes software and hardware from Atari, Commodore,
Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Snail. The shipping cost
depends on both the weight of the package and the distance that it
is traveling. Buyer has the choice of either first class or parcel
post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 7.50 ATARIWRITER
$ 7.50 BASIC
$ 6.00 GALAXIAN
$ 9.00 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

*****

COMMODORE 64 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 9.00 FAST LOAD (Epyx)
$ 7.50 FROGGER (Parker Brothers)
$ 5.00 JUPITER LANDER
$ 5.00 KICKMAN
$ 5.00 MAGIC DESK I
$ 5.00 MUSIC COMPOSER
$ 6.00 OMEGA RACE
$ 5.00 SPEED/BINGO MATH

Complete cartridges. With box, and manual:
$ 7.00 KICKMAN

*****

COMMODORE VIC-20 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 5.00 ADVENTURE LAND (#1914)
$ 5.00 ALIEN (#1906)
$ 5.00 AVENGER (#1901)
$ 5.00 GORF (#1923)
$ 5.00 OMEGA RACE (#1924)
$ 7.50 Q*BERT (Parker Brothers)
$ 4.00 RADAR RAT RACE (#1910) -- no label
$ 4.00 SPEED MATH / BINGO MATH (#1933)
$ 5.00 THE COUNT (#1917)

Loose cartridges with manual. No box:
$ 5.00 COSMIC CRUNCHER (#1922)

*****

TEXAS INSTRUMENTS (TI 99/4A) COMPUTER:

Loose cartridges, no box or manual:
$ 4.00 ADVENTURE
$ 4.00 BEGINNING GRAMMAR
$ 4.00 BLASTO
$ 4.00 CAR WARS
$ 4.00 CHISHOLM TRAIL
$ 4.00 HOME FINANCIAL DECISIONS
$ 4.00 HOUSEHOLD BUDGET MANAGEMENT
$ 4.00 HUNT THE WUMPUS
$ 7.50 JAWBREAKER II (Sierra On-Line)
$ 4.00 MUNCH MAN
$ 4.00 PARSEC
$ 7.50 PROTECTOR (Atari)
$ 4.00 TI INVADERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER with box, User's Guide (175 pgs.), power
supply, and RCA cable.

I will also throw in a second non-working COMMODORE 64 for parts,
FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #8

COMMODORE 1541 DISK DRIVE with power cord, and serial cable.

$25.00

*****

LOT #9

COMMODORE 1541 DISK DRIVE.

Power cord and serial cable are available from Radio Shack for
around $11.

$20.00

*****

LOT #10

NEW RF SWITCHBOX PURCHASE OPTION

RADIO SHACK COLOR COMPUTER with RCA cable, built-in power cord, and
built-in BASIC.

This is a complete system, except for RF switchbox.

$14.00

*****

LOT #11

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF
switchbox, Beginner's BASIC (150 pgs.), and one function key strip
(for keyboard).

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to use.

$25.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video
game systems and/or cartridges in trade towards any of these items.
Systems I am interested in include, but are not limited to, the
following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need Atari color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need TI color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking
for now is software (primarily cartridge based).

Please send a list of what you have, and please be specific (indicate whether or not cartridges and/or systems include the box and/or instruction manual). Please mention any controllers that are included.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

B> I am just curious if anyone has investigated what would be
B> necessary to do VT100 emulation on the XEP80.

It doesn't need to be done. There is already a VT220 emulation that has been written for the XEP80 80 column adapter. Strangely enough, I believe that this was called "VT220.EXE" or "VT220.COM". The program was --SUPPOSED-- to allow you to emulate a VT220 on both the XEP80 and on the regular ATARI screen, but whenever I ran it, my regular console screen would freeze up and lock. This leads me to believe that it might only write onto the XEP80 adapter, since I never got the program to write to the regular screen. (Unless there was some trick like a screen toggle key of which I was unaware....) The XEP80 program VT220.EXE is a terminal program, only, and does not allow for file uploading and downloading. (As I never had an XEP80, I could never test it fully.)

2619. [--- BOBTERM and SPARTA 32gx ---]

Newsgroup: comp.sys.atari.8bit

From: winston@merk.com
Message-ID: <DEMtE0.Gpr@merk.com>
Source record: 88641

Here is my hardware setup:
ATARI 800XL (stock), ATARI 850 interface, Hayes "Hayes Stack"
SMARTMODEM 1200 modem, ATARI XF551 drive, AMDEK COLOR-1 monitor

Using SPARTA-DOS 3.2gx and BOBTERM 1.22 I just attempted to perform a YMODEM BATCH upload to a UNIX system running SZ/RZ. Strangely enough, the last sector of each one of my files was never transmitted, and the end of each and every file was truncated! I am going to try and switch over to MyDOS and try running BOBTERM 1.22 again. Has anyone had similar problems ? Are either SPARTA-DOS 33a or BW-DOS up on the Michigan archives ? Would switching out of batch mode solve my problem ? Thanks for any and all advice.

2620. Re: [--- BOBTERM and MyDOS 4.50 ---]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-09 00:00:00 UTC
From: winston@merk.com
Message-ID: <DEMzAB.J4D@merk.com>
Source record: 88642

Hmm... YMODEM BATCH under MyDOS 4.50 also appears to have some problems. Sending YMODEM BATCH to UNIX SZ/RZ appears to be sending double line endings. Very strange. Hmm... perhaps I have to manually override the CRC matching ? In any event XMODEM 1K appears to be working perfectly, at least... yay! Does anyone else experience problems with YMODEM batch ? Does anyone else have a work-around for it ? Thanks.

2621. [--- cal.shar ---]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-09 00:00:00 UTC
From: winston@merk.com
Message-ID: <DEn1K2.Jy4@merk.com>
Source record: 88643
Body handling: HTML body converted to readable text

For those who say that UNIX is impossible to do on the ATARI 6502 8-bit...
For those who are interested in ATARI CC65 SMALL-C compilers under
SPARTA-DOS...
For those who are interested in 'C' programming in general...
I present the following SHAR UNIX shell archive:

NOTE: It is an extremely "quick-and-dirty" conversion of an early CAL
program. To test it out try invoking the following: cal 09 1995 > S:
(It should print to the S: device in a manner similar to TEXTPRO.)
The program needs to be compiled with CC65. The executible code will run
under both SPARTA-DOS and MYDOS. Some ATASCII alternate versions of the
built-in help screen have been included as UUENCODED files. The coding is
"quick-and-dirty". The looping algorithm is clumsy. The built-in help
screen is slow. It is printed, when it should be preloaded into memory as
an alternate screen and then "pointed to". The command parsing is
primitive and pathetic. It uses multiply chained IF statements in a
dispatch table instead of the more elegant "switch" statement logic.
What can I say? The program works! I kept the logic very simple. Maybe
you expert programmers out there can clean the program up a bit and make it
"elegant" for me. I tried compiling a later version of CAL under CC65, but
it required a call to the system time vector and generated logical value
errors (a.k.a. LVALUEs) when attempting to use indexed pointer array logic.
I'm not sure exactly what is wrong with it, as CC65 has a few quirks and
the source modules would need some picking apart. In any event, have fun
messing around with the SHAR. Let's see if it can be made better. Perhaps
the output could be made to be redirected through the "R:" device as well
as the "S:", "P:", and "D:" devices ?

X * Revision History:
X * =================
X * Modified for the ATARI 6502 8-bit
X * CC65 SMALL-C compiler (5/11/95):
X * o READARGS() line parsing added.
X * o Programming loop logic added.
X * o Exit using "QUIT" or "quit".
X * Modified for I/O redirection
X * CC65 SMALL-C compiler (8/19/95):
X * o "end", "exit" exits added.
X * o help, man, ?, screen added.
X * o S:, D:, P: redirection added.

Hmm, I will have to investigate that file. BTW, I did investigate VT850.
The emulation is QUITE nice. HOWEVER, without docs I can not figure out
how to change baud rates. The read.me states that documentation will be
provided upon shareware fees being paid BUT that was 1991. Can anyone
confirm the author is satill out there? If not can anyone tell me how to
change baud rates, etc?

Thanks
-Marlin

Use a VCR. You could get a used one in a thrift store for as little as
20 bucks.

(Winston S. talks about ymodem on unix and BobTerm.)
I'm 95% positive that the ymodem batch in BobTerm is NOT the ymodem you
are using on the unix. You said rz/sz which is Chuck Forseberg's
zmodem. It would be sb/rb for dsz ymodem, which isn't what BobTerm's
ymodem is at all. I wonder how the thing worked at all. I think
BobTerm's ymodem batch is more like a 1k xmodem with filenames
automatically sent/received.

(Somebody asks about term programs for xm301. somebody else says
BobTerm 1.2? comes with driver for xm301.)
YES, get that Jim Dillow driver for the xm301. If it is the R: handler
I'm thinking of from Jim Dillow, it allows running any 850 type term
program using the xm301. That R: handler is so good, I suspect you can
run Flickerterm, Ice-T or any of the 850 type term programs.

From: aj445@cleveland.Freenet.Edu
Message-ID: <42t1s9$6fb@usenet.INS.CWRU.Edu>
Source record: 88649

Hi,

A couple weeks ago, I did the SuperVideo 2.1 mod to a 64k 600xl
that I have. I even did the errata which was published a
couple months later. I get video out on my 1702 with split
luma/chroma, but it is very "grainy", almost like lines going
thru the screen. It is readable, but looks terrible. Now, I'm
no novice at this Supervideo bit ... I did a 130xe , and a 1200xl.
Both came out fine, and the 1200 xl mod was a lot more involved
than the 600xl.

Anyone ever attempt the 600xl mod from AC, some years ago? Is
Ben Poehland still around?? Any help would be appreciated.

Bill ... still using 8bits (and others) after 16 years ..

Hi,

I was wondering if anybody had any hints on using the program SIOcopy
(the program using a cable between the Lpt1: port on an IBM and the
SIO port on an Atari Drive to transfer files) had any problems
with the program or the construction of the cable.

I am currently using a 386/40 and a Happy modified 1050 and had
completely no luck with the program.

Any suggestions?

Thanks,
Tom

Yes, I tried that and it didn't work for me either. Go for SIO2PC, it works great, and seems to be what almost everyone here is using. The plans for building it are in the file, but the cable & box work with APE as well as SIO2PC.

HCF - Halt and Catch Fire

Just was given a literal vanload of 8-bit stuff. More than I even had back before I got rid of my stuff in '90 or so, which I've been regretting ever since.

Good to be back home.

>When using the BIT instruction, are the N, V and Z flags set off of
> the Accumulator, Memory or the byte that resulted from the 'invisible' AND?

The Z flag is set to the result of the invisible AND.

The N and V flags are set directly from the memory byte, bits 7 and 6
respectively.

John Harris - jharris@cup.portal.com

2634. Re: 6502/6507 data sheets?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-10 00:00:00 UTC

Some software uses the BIT instruction as a "skip-two-bytes" instruction,
where the "address" following the BIT opcode is another instruction.

Source record: 88558

Thom Bone (thombone@ix.netcom.com) wrote:

: What is the Supervideo mod? What is it supposed to do?

It is the video upgrade to the Atari 8-bit XL and XE series that Atari should have had in the first place, especially for the XL series of their 8-bit home computers.

It adds the missing separated composite chroma line (and luma line on the 600XL!), boosts the separated composite monochrome or luma line and enhances the overall quality of the video signal, and is especially noticeable on a good split video color composite monitor like the Commodore 1701/1702/1802/1902/1084, Magnavox 1CM-135, Teknika MJ-10, Thompson, and many other similar monitors with the separated composite luma/chroma capability.

The color saturation and definition is boosed significantly, the graininess is gone, the shadowing effect and color bleed is practically eliminated, and it looks like great! The difference is quite visible, and the mod is especially recommended for the those with original 1200XLs, and the 800XLs. Even the XE line of computers are improved, especially for sharpness and color boost.

I heartily recommend it. All the details are in the Decembe 1993 issue of ATari Classics.

I'm stuck in the same quandry as most of you. I have this MASSIVE 486 Dx2/80 w/32meg RAM, 3gig hard drive space, 4x CDrom, 150meg IOMEGA removable and SVGA, with all 32bit cards and all the latest OS's in BOOT MANAGER (OS/2 Warp, Windows NT 3.51 workstation, Windows 95 and Linux), yet I cant quite decide which one I SHOULD be using on a regular basis.

I'm finding myself not even touching the Atari, yet I know the PC is costing me a fortune and is really serving no vital function at home -- except for my when my wife uses it for Word Perfect 6.1 or Word 95 and spreadsheets.

My Atari system went from 4 terminals all connected via the CSS MUX to just ONE stock XL (with US+ OS) running on an MIO, 14.4k modem and whatnot.

I guess when I took my BBS down, I just kind of started to loose interest in the Atari. I've often considered hooking up the MUX again, but dont think it would get utilitized.

This message is being typed on my PC via Procomm Plus for Windows 2.1 (sigh)

The N and V bits are COPIED from the argument in memory.
The Z bit is a result of your 'invisible' AND-operation.

I cannot help you in instruction-timing, because there are over
150 various instructions and I cannot remember them. But at my home
I have the timing-table, so if you need it, please mail me.

Hi -

I really need to clear out some room, so I'm selling my 8bit stuff.
Below is a fairly complete list. Will sell the entire system or
parts.

800XL w/ Newel 256K
1200XL
1050 without case but with US Doubler
Hybrid Arts Midimate and Miditrak III
MPP Microport (6521 on a board, plugs in to expansion slot)
Parrot II (sampler)
CX77 drawing tablet
MPP 300 baud modem (joystick interface)
MPP Parallel interface

Books and software
Spartados 3.2d
Basic XE
Syncalc
Paperclip
Mapping the atari rev. ed.
Basic turbocharger
Hackerbook for your atari computer
6502 programming
Analog Atari 8bit extra
Atari 400/800 disk guide
Scanalyzer
Your atari comes alive

and many, many disks of software plus many years of
articles from Antic, Analog, and Compute!

Please, make me a reasonable offer on all this stuff!

oops, almost forgot... plenty of cables and power supplies!

I need to buy a new Omnimon OS chip for my 800xl. I used to have one I
got directly from Newell industries, but it long since died. Ive had zero
luck getting FTE to answer my e-mail, so im looking to buy it from
another source.

Thanks

Steve

What is the Supervideo mod? What is it supposed to do?

ATARI/COLECO/C64/FAIRCHILD/INTV/ODY2/TI99/4A AUCTION

I am posting this auction here because I believe that some
people who read this newsgroup are interested. Here is the
order of the items in this auction. There are several
very good cartridges in this auction, so please
take the time to look through this auction for things
you might want and then send me a bid on those items.

HERE IS THE ORDER:

ATARI 2600
ATARI 5200
ATARI 7800
ATARI 400/800
ATARI MISCELLANEOUS
COLECOVISION
COLECO ADAM
COMMODORE 64
FAIRCHILD
INTELLIVISION
ODYSSEY2
TEXAS INSTRUMENTS 99/4A
MISC SYSTEMS

This Auction will end at Midnight Mountain Time on
SUNDAY, SEPTEMBER 17, 1995 unless bidding is
still strong.

Atari 2600 cart's are all preceded by their VGR rarity
rating.

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

no cables

-Atari Keyboard Controller

TRADES:

I will be willing to trade for Sega Saturn stuff, 2600 Berenstain Bears
and
other ER and UR carts....

HERE ARE THE RULES:

1. This auction will end on Sunday, September 17, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: james.manazer@m.cc.utah.edu

2646. Re: [--- BOBTERM and MyDOS 4.50 ---]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-10 00:00:00 UTC
From: bmarcum@iglou.iglou.com
Message-ID: <DEpLAH.LIy@iglou.com>
Source record: 88569

I've used Bobterm's Ymodem to download plenty of files from Unix systems
using sb; I'm not sure about the uploading. I think the main difference
in the Ymodem batch protocols is in what they send following the filename.
Sb/rb sends a lot of ascii numbers representing the file length and
time/date stamps. (I haven't used Bobterm with Spartados; does it use
this time/date info, or does a downloaded file show the date that it was
downloaded?) I used to use a CP/M system that would show ridiculous
file lengths like 1280K while downloading, but the downloads turned out
all right.

>
>I heartily recommend it. All the details are in the Decembe 1993 issue of
>ATari Classics.

I heartily recommend it as well. I did the upgrade to my 800XL a while
back, and noticed the change in FlickerTerm-80 immediately. But, I hadn't
played many games since then...until last night. Whooee! What a huge
difference it makes! Centipede doesn't look washed out any more. The
black background is /black/, not a grainy brown-grey. Ms. Pac-Man and
Pac-Man also look incredibly good. Man, what a difference!
If Atari had only put the $2 of extra parts in there, they would
have done themselves a /big/ favor.

Sounds like you don't have much use for computers, period, at home
anymore.

>I guess when I took my BBS down, I just kind of started to loose interest
>in the Atari. I've often considered hooking up the MUX again, but dont
>think it would get utilitized.

What do you use the 486 for? If it's just word processing, then
it sounds like it's time for you to back off from computers for a while
until you get the "itch" again. :) Heck, if all you used your Atari's for
was running the BBS, mebbe you don't need a computer for yourself at all,eh?

>This message is being typed on my PC via Procomm Plus for Windows 2.1 (sigh)

Why? :) Use that ol' Atari to connect. :)

I was thinking about the "It's a matter of choice" issue yesterday,
and decided to check in on a couple other "orphan computer user" newsgroups.
I picked the TI 99/4a group and the Apple][group for my little survey
of what's going on.
The TI folks had about 100 messages posted in the last 14 days. That's
about 1/4 the posts we get here. But, all the posts were good, much
similar to what we discuss here. In fact, there's a guy there developing a
FT-80 type terminal program with 80 columns, ANSI, VT100, etc. for their
machine. It's very much a live group, enjoying their computers WAY beyond
the life TI gave them.
The Apple people had about 800 messages posted in the lat 14 days,
which is double our typical quantity. But the content! Oh, gad, there
were three or four threads chock full (30+ in one) of flames directed toward
some guy who is developing software to provide "3D sound" from the
Mockingboard (a device similar to the Pc's Sound Blaster, but which came out
long before SB did). The flames started out with stuff like "There is No

way you can produce 3D sound from a Mockingboard, no matter WHAT the software," and ended with a bunch of arguments about each side's use of grammar and spelling! Yeesh!
Now, the TI folks had been written off by TI long, long ago. They got squat when compared to the Apple folks, in terms of products and support. Yet the TI community is cohesive, and the developers (like the person doing the 80-column terminal) are treated with some degree of respect and gratitude.
In contrast, the Apple folks, who were given everything for YEARS from Apple and a /slew/ of other companies, are bickering about whether a developer can make a product that sounds quite interesting, instead of just letting him do it and see whether he fails. Doesn't cost anything for folks to let him try.
I think it's interesting to see that those of us who were generally mistreated by the computer community (TI and, to a lesser extent, Atari users) and the manufacturers of our products, magazines, etc. have pulled together so well, when those who had all the advantages ("Apple][Forever," remember? Yeah, the Apple][people are still bitter that did not hold true. but gad, they got 100* the support we did, let alone the TI people) are fragmented and bickering.
Oh, sure, we have our fights here, too - but it's about things like pirating, not petty squabbles over whether Bill can write Geneocide for chrissakes!

Anyway, were the Atari to disappear from the face of the earth tomorrow, I'd definitely choose to be a member of TI rather than the Apple community.

And, to relate this back to the subject at hand, the Apple][people are much more like the Mac and especially the MS-DOS/Windows people - fractionalized, fragmented, bickering people.
It's been said that you know a person by who they associate with.
I'd rather associate with you folks than MS-DOS/Windows, Apple, or any other group. It's an easy choice. :)

2649. page-flipping

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-10 00:00:00 UTC
From: bbingham@turbo.KEAN.EDU
Message-ID: <Pine.OSF.3.91.950910221931.10372A-100000@turbo.kean.edu>
Source record: 88572

Hello, I have a couple questions about page-flipping in games.
Excuse me if I phrase this stuff awkwardly :)

1. How neccessary is it to page flip? (might be a stupid question)

2. Let's say your program is small. As I understand it as Antic is
drawing the screen, your program is excecuting. Should you use VBI or
whatever to control flips, to avoid switching pages in midst of Antic's
drawing?

Also interested in:
Line drawing algorhythms(sp?)
Ray casting techniques.
What techniques did WayOut use.

msg me here or bbingham@turbo.kean.edu

Thanks!

2650. SIO2PC hardware & more...

I have SpartaDOS 3.2e and SpartaDOS X 4.20 (with the 4.21 ATARIDOS.SYS handler).

So what's the difference between the latest version (whatever that is) and the standard (v3.2e) version that came from ICD?

(did they finaly introduce a "default drive" like MyDOS has)

Source record: 88655

Like me - I got the following:

800XL (stock, needed cleaning)
1050 disk drive (stock I guess, never tested it, don't use floppy drives)
19 cartridges (1 didn't work, some needed a little connector cleaning,
a few are dups of what i have)
1 joystick (quickshot ii plus)
1 printer intfc (no use for it)
All connectors
All power-sups

All of this I got just for walking over an overpass and picking it up.
I'd have sincerely thanked this guy by now but my e-mail-box got trashed
not long after this transaction and was replaced by an ANCIENT backup file.
>:^(

Oh yeah, and all I was told I was going to get was an 800XL + 1050 (for free)
and thought I'd be lucky to get working cables and supplies!

Cool, huh!? Anybody need a 1050, printer interface or some random (popular)
carts?? :) $0!

PS- I also have literally thousands of other titles. If you need something let me know and I can get it for you or at lease try anyhow. Some of the other titles I have already available: 7 cities of gold, Alternate Reality: the city, Atariwriter, Fight Night, RedMax, Tomahawk, Paperclip, Hardball, Bop 'n Wrestle, Speed King, and others. Please note I will also trade titles for a copy of kennedy approach's instructions. Thanks again!

2655. Atari 400 w/11 carts forsale

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-11 00:00:00 UTC
From: jap5r@watt.seas.Virginia.EDU
Message-ID: <DEqq00.4CG@murdoch.acc.Virginia.EDU>
Source record: 88577
Cross-posted to: rec.games.video.classic,rec.games.video.marketplace,comp.sys.atari.8bit,misc.forsale.computers.other.system

I have an Atari 400 computer which I would like to sell.
It works and includes the following:
Atari 400 with attached video cable
Power supply
1 working joystik
2 joystiks with the boots missing, condition unknown
the following carts (loose all working)
Dig-Dug
Super Breakout
Qix
Donkey Kong
Centipede
Basic
Music Composer
Asteroids
Pac-Man
Football
Space Invaders
the following cassettes (loose condition unkown)
Black Jack
Hangman
Eastern Front
Video Math

Price: $40+shipping. Please No trades. I will be selling all of
my classic video games over the next few months (waiting to get some
out of storage) due mainly to space and the fact that I need a
powerbook for school. Look for these systems in the future:
Colecovision/Amiga/Vectrex/C=64/Tandy/Microvision/TI/Lots of Atari
(Anybody want all of it?)

> I had a 7800 and it appeared neither better nor worse than the 8bit
> computers graphics-wise.
>
Actually, the 7800 was a NEW design -- it wasn't just a repackaged Atari computer like the 5200. As such, it had more RAM (than the other game systems), better graphics, and better sound than the 8-bit computers/game systems that came before it.

The was designed by old (Warner) Atari to be MUCH more than just a game machine. It had an expansion slot which would allow one to connect an optional keyboard and XL-compatible peripherals, but it was NOT compatible with XL software and this is why the computer portion of the system was never actually released.

> Atari could have saved themselves two failed systems if they had scrapped
> the 5200 and 7800 from the get-go in favor of an XE game system style
> system using the 8bit carts.
>

Personally, I don't consider the 5200 a "failed system." It died when EVERYONE's systems died. Coleco, Intellivision, Vectrex, and Atari all lost big-time on the game system market in 1983-1984.

New Atari is to blame for the failure of the 7800. It is technically superior to the Nintendo Entertainment System (the original) in all areas, but, in traditional new Atari style, they released the hardware with only the games that old Atari had finished. They figured that these would be enough to get the sales going, and then the third party developers would pick up the slack. Unfortunately, by 1985 the games that were available for the 7800 were 2 years old and of little interest to the game-playing population of the day. This is why the NES made it; they made current games available for their system.

Now, in 1995, it looks like Atari is doing the same thing with the Jaguar. How's the saying go? Fool me once, shame on you. Fool me twice, shame on me.

From: "Mr. Kimberly M Beattie" <kimbo@interramp.com>
Message-ID: <430osi$555@usenet1.interramp.com>
Source record: 88580

I donated my "old" Atari 130XE to a local day care center and the kids loved it! They loved playing the Atari games so much they finally broke the joystick. So I'm looking for a joystick, or information on where I can get a joystick(s) for the Atari. I've checked around locally, but can't seem to find anything. Does anyone have a suggestion (or joystick)?

Reply to the group or by email at kimbo@duster.com.

Thanks.

2660. Q: Use of Game Cartridges and Cassette Games in Emulators?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-11 00:00:00 UTC
From: mbouthil@aol.com
Message-ID: <431at0$5jl@newsbf02.news.aol.com>
Source record: 88582

I had a few questions regarding the use of game cartridges and audio cassette based programs with the various Atari emulators (Rainbow and PC Xformer). Bill Kendrick suggested I post this in comp.sys.atari.8bit so everyone could have a shot at them:

1) Is there any way to transfer game cartridges to a file so they can be used with an emulator?

- If so, how is it done (what special hardware/software is required).
- What copyright issues are involved? (Is it OK if you destroy the original cartridge after doing this and only use the ROM image on one computer at a time?)

2) Is there any way to transfer audio cassette based games to a file so they can be used with an emulator? These are machine language games not BASIC programs.

I assume this would be easier, since it must be possible to write a program that reads data from the cassette tape and writes them to disk. I don't don't know how to do it though...

It would be really cool if someone could figure out a way to "read" cassette data through a PC/Mac microphone input. This could be accomplished in real time or by sampling/recording the tones as a WAV file (or SoundEdit file on the Mac). Actually this could become a

really convenient way to transfer data between any Atari and a host computer as long as the files were small. It would only require an audio cable.

Re: A matter of choice.
To Jim and others who aren't sure what their Atari8 is good
for.
I have three computer systems, A8, ST and pc XT clone. They
each have their own strong points. The ST for midi, the XT
for just about everything, word processing, data base,
spreadsheet, telecomm, income tax programs. The pc has
current software I can run for income tax each year, legal
document preparation and 80 column telecomm. The ST has
most of the 'main' stuff computers are used for, but no
current software like tax preparation. And no updated
software, like telecomm (freeze dried is pretty good tho).
My point is, Jim, you have a kid now. You may be getting
others. In a very short while your kid, like my grandkids,
are going to want to do stuff on the computer and you are
going to want to do stuff with them. There's very little on
my pc or ST I can do with them. There's a TON of stuff on
the A8 I can set up and pretty much let 'em rip themselves.
So, do like I do, and grab all the kiddie software you can.
The harder arcade and other games could be very interesting
even to teen agers. A8 is a fantastic game machine and you
don't have to spend $69.95 to get a space blastemup and have
a sound blaster, CD rom, 32 megs memory 1 gig hard drive and
all that.
(Some of my 4 and 6 year old grandaugter's favorites. 'Grandma's
House', 'Hodge Podge', 'Tink's Adventure'. I have a muppet's
learning keyboard they also like very much. As far as I know
there is no muppet's keyboard for my other computers.)

>it would replace its buffer with what is being written then write the new
>data and the old cached data to the 512 area. Of course, for a random
>write somewhere you would need to first READ the 512 data then update..
>which makes a big slow down...
>Is this how its being done?

No, writings aren't cached, because is may be dangerous for your data.
If you wrote a file, which took the odd number of sectors (13, for example),
its last sector wasn't written to the disk - it remained in the cache. So,
if you switch off the power then, the data will be lost...

Generally, it is necessary to read-and-write 512 bytes to store 256 bytes
to the disk, or this way is at least safe. Now I am thinking about another
way to improve the speed, and I hope, that it will greatly speed up both
operations (i.e. reading and writing) from their current levels: 31 and
7 kilobytes per second for reading and writing respectively. These levels
cannot be identified with so called 'max-transfer-rate'. This rate is
about 55 KB per second in my disk :) and will be more.

Bye

Usually a good idea; I rarely do it and it shows, but I don't usually care
(I'm either short on memory or it doesn't look too horrid).

>2. Let's say your program is small. As I understand it as Antic is
>drawing the screen, your program is excecuting. Should you use VBI or
>whatever to control flips, to avoid switching pages in midst of Antic's
>drawing?

Yes, always use VBI for page flipping stuff! Or you can use DLI, actually.
I had a friend write a ColorView mode routine for me (ate up all of my
RAM though, the way it wanted the images to be stored! >:^( ) - instead
of using both DLI (color changes) and VBI (frame flips), it simply did
something funky at the END of the DLI to make the next frame look different.
It was all assembled stuff (as if I understand 6502 assembly anyway :)),
so I don't know exactly how he went about it, but it was a neat routine.
I'd like him (or myself) to write a banked-RAM version of CV modes...

>Also interested in:

What I did (way back then) was to buy a heavy-duty arcade
joystick and 'fire' button, put them in a box, and hooked
it up using the old cable/connector.

I don't even know if today's arcade games still use 4-switch
joysticks, but mine has never worn out.

Rick Michael Cortese absurdly writes:

>Steve; Number of cycles is a little long, something like 156 op codes
>depending on mode i.e. LDA $1000 vs LDA $00 vs LDA $30.

There's no difference between LDA $00 and LDA $30 (they both take 3 cycles,
opp. to LDA $1000, which takes 4 cycles). Perhaps you meant: LDA #$30.
It takes 2 cycles.

>also a problem with # of cycles changing if a page is cross, i.e.
>$600 BNE $610 ;Takes 2 cycles
>$600 BNE $5F0;Takes 3 cycles.

BNE takes 2 cycles, if the CPU don't do the jump. If it does, the BNE
takes 3 cycles on the same page, otherwise 4 cycles.

>The BRK instruction always jumps through $FFFE-F, in the Atari this is
>a vector that points to the vector table on page two<?>. On power up
>it just points to a routine that clears up the stack/RTI.

Absurd. The IRQVEC ($FFFE) doesn't point to a vector in a page, but to
the routine called SINRDYI ($C030) in ROM. This routine has to check the
source of the interrupt (whether it was POKEY, or a new device or BRK or
something else), then call a proper interrupt-routine by a proper vector
in RAM.

>and a few other said, the 6502 series has a hardware glitch which allows
>the BRK instruction to fail on ocassion.

Don't think. The mistake is rather in the documentation, than in the CPU.
The BRK never fails, if the programmer knows, that this instruction is
TWO BYTES LONG (the second is ignored).

>A REG now set to zero & n & z flags set

The N bit is set to zero for this example.

>I never
>really thought about it, but for doing stuff like determining string length
>on an Atari where the CR=>155, I guess this would be a good instruction to
>use since it doesn't modify the bytes being examined. Ditto for string
>compares.

Pity. The BIT instruction is very useful for various purposes. You can
easily test 7 and 6 bits in any memory location, for example: BIT DDEVIC
is the fastest and shortest way to check, whether the called device
is a disk drive or not:

```
BIT DDEVIC
BVS NO_DRIVE
```

because in all other codes ($40, $50, $60) the 6 bit is set to 1. BIT allow you also to check, whether the current SIO-operation is writing or not:

```
BIT DSTATS
BMI WRITE
```

and so on.

Nevertheless, this instruction isn't very useful to test string-endings, due to lack of addressing modes.

>Been a while
>so I could be wrong, but I remember thinking at the time, "It must be they
>are testing it on [6502, 6502 emulator] or the 6507 will just ignore the
>upper address bits.

As far as I know, the 6507 address space is 8 KB.

Joe, your comments about who you'd rather associate with really hit home! I didn't buy my first clone until maybe 86 or 87 & I'd have to admit for being a piece of junk, my experience with other users of that thing weren't that bad, but my 2nd one! I remember MAT*RAT saying something like, "You know what I hate about MS DOS? Everybody has their hand out!" in the CIS 8 bit sig. Tandy was having a parking lot sale & I picked up one of their '286 clones & 20 meg hard drive for about $500. For the time, Tandy was a better choice then IBM since most software houses were supporting the 320x16 color mode & the built in sound. Sure enough, as I'm leaving the parking lot a guy approaches me & says, "That's a nice computer, I have the same model. I use it in my business as a consultant. Buy the way, you have to know how to set the jumpers to use it with a non Tandy hard disk." My being my usual dense self said, "Really! What's the settings?" to which the guy responded, "Hey! I'm a computer consultant! If you want me to tell you how to set it up, you'll have to hire me!" Sheesh! That set the mood for most of my dealings in the MS DOS world. Even when I have to expose myself to the MS DOS world on a daily basis, their is NEVER a sense of community or comaraderie.

All the 8-bit computers and the 5200 have basically the same hardware;
the graphics capabilities are identical. The 7800 has an interesting
graphics chip which is similar to one component in the Jaguar graphics
system (the object processor). Basically, it lets you write fancy
display lists that, more or less, let you display two-dimensional chunks
of memory at arbitrary x and y coordinates. A sprite system, really, but
you have to fool with the display list to move things.

Right-o, Rick. We have a superlative group here (and, I bet, in the
A8 world at large - meaning those who cannot get online). At first I was
amazed at how large a percentage of the messages in this newsgroup are
pleas for help and numerous replies to those pleas. I'd never encountered
that before. It's great, and a wonderful resource. None of us know
everything, so we help eachother whenever we can. It's a real help to
know that - when Carole and I started the SV 2.1 upgrade with no previous
experience with such upgrades, I was given confidence by knowing that, if
i encountered trouble, I could come here for answers to my questions.

As I said before, I'm glad to be a part of this.

i'm looking to buy a disk drive for my old atari 800xl. i used to have a model 1050 disk drive, but i would settle for any compatible drive. if you have one to sell or know of someplace where i can find one, please send me some email with the information. i will be greatly appreciated...

In article <hxHilYW.ransom22@delphi.com>,
Joe Walsh <ransom22@delphi.com> wrote:

>[...] not petty squabbles over whether Bill can write Geneocide for
>chrissakes!

Ah, but I can't. :) At the moment. My programming skills seem not what
I imagined them, esp. when trying to work with Action! - great, superb,
fast language; but it strives to be Sweet16ized!

But - I will have access to some hefty AV equipement
(PowerMac8100-something/AV plus color page scanner, color slide scanner,
and a VCR video setup!) and may get some help from, say, Hard Software or
maybe Tight; that'd be cool. Incorporating their stuff into my stuff may
take the Action! knowledge of Rick Cortese, but seeing some of the stuff
these Euro-dudes can do, it'll be well worth it. :) (I could ALWAYS do with
some good Atari synth music - digi stuff I can do on my own, but I suck
otherwise.)

Also, I've found (well, always had it, never got around to looking at it)
some XE RAM banking ditties in Action! (coulda done it myself, I suppose,
but I'm not very confident when it comes to that sort of stuff for some
reason).

Anyway - I guess what I was TRYING to say was "I can't do it at this point",
but I guess I've proven myself wrong. Of course, I'd MUCH rather do it
in 3D like Castle Wolfenstein 3D or DOOM or Marathon, but that'd DEFINITELY
take not only help from Europe but also a Sweet16-pumped Action! compiler! :)

-bill!

2677. re: 6502/6507 data sheets

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-11 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <145358@cup.portal.com>
Source record: 88599

```
;Rick Michael Cortese absurdly writes:

>Steve; Number of cycles is a little long, something like 156 op codes
>depending on mode i.e. LDA $1000 vs LDA $00 vs LDA $30.

;There's no difference between LDA $00 and LDA $30 (they both take 3 cycles,
;opp. to LDA $1000, which takes 4 cycles). Perhaps you meant: LDA #$30.
;It takes 2 cycles.
Caught me, typo. I reply on line so this happens a lot

>also a problem with # of cycles changing if a page is cross, i.e.
>$600 BNE $610 ;Takes 2 cycles
>$600 BNE $5F0;Takes 3 cycles.

;BNE takes 2 cycles, if the CPU don't do the jump. If it does, the BNE
;takes 3 cycles on the same page, otherwise 4 cycles.
Caught me here also, read the online reply statement
>The BRK instruction always jumps through $FFFE-F, in the Atari this is
>a vector that points to the vector table on page two<?>. On power up
>it just points to a routine that clears up the stack/RTI.

;Absurd. The IRQVEC ($FFFE) doesn't point to a vector in a page, but to
;the routine called SINRDYI ($C030) in ROM. This routine has to check the
;source of the interrupt (whether it was POKEY, or a new device or BRK or
;something else), then call a proper interrupt-routine by a proper vector
;in RAM
Your nit picking here, Steve asked for more info on this & I explained it
fully and acurately. Also your ref to SINRDYI in $CXXX is only good for the XL
OS. If you're going to be petty you should at least try to be asaccurate as
you're demanding others people to be.
>and a few other said, the 6502 series has a hardware glitch which allows
>the BRK instruction to fail on ocassion.
;Don't think. The mistake is rather in the documentation, than in the CPU.
;The BRK never fails, if the programmer knows, that this instruction is
;TWO BYTES LONG (the second is ignored).
You know, I think you just possibly will be corrected about this by more
people then myself. John Harris posted some code that demonstrated the bug
beyond any doubt & several other people pulled out docs for later
processors, like I said on line so..., the 6502C & 65816 where they said they
corrected the bug in the BRK instruction. I doubt very seriously they fixed a
bug that wasn't there. You just don't know what you're talking about.
>A REG now set to zero & n & z flags set
;The N bit is set to zero for this example.
Steve made the same assumption, i.e. by set I meant set to the appropriate
value. That is, you can set something to zero, you can set something to
1, get it?
```

>I never
>really thought about it, but for doing stuff like determining string length
>on an Atari where the CR=>155, I guess this would be a good instruction to
>use since it doesn't modify the bytes being examined. Ditto for string
>compares.

;Pity. The BIT instruction is very useful for various purposes. You can
;easily test 7 and 6 bits in any memory location, for example: BIT DDEVIC
;is the fastest and shortest way to check, whether the called device
;is a disk drive or not:

;BIT DDEVIC
;BVS NO_DRIVE

;because in all other codes ($40, $50, $60) the 6 bit is set to 1. BIT
;allow you also to check, whether the current SIO-operation is writing
;or not:
Well, it seems I usually bang on the hardware anyway. I still can't see what
the savings your talking about. This seems to be a constant form of nit picking
so let me explain something to you. It does not make a heck of a lot of sense
to talk about saving a cycle or two when you are doing something like saving a
file to disk or cassette. Aren't you the guy that was talking about the
freaking Turdo Tape OS? Ask me if I care if I save 1/100,000 of a second when
I'm writing a 10k file to disk, let alone a tape! Maybe you could come up with
a better example where the BIT instruction will save more then 1/1,000,000% of
time.
;Nevertheless, this instruction isn't very useful to test string-endings,
;due to lack of addressing modes.
Do you want to rethink that one? I'd reply with example code, but I'm online
again<sigh>. Just a matter of style, probably could be done faster another way,
but I can't see any problems with doing a routine that used the BIT
operator that would check for EOL.
>so I could be wrong, but I remember thinking at the time, "It must be they
>are testing it on [6502, 6502 emulator] or the 6507 will just ignore the
>upper address bits.

;As far as I know, the 6507 address space is 8 KB.
When Steve asked for more info, he said <correct me if I'm wrong Steve> he
had 6507code written for the VCS that was targeted for somewhere in the $FXXX
region.
;Regards
:KMK
Look, your FIRST line of your reply. You've made several errors, demonstrated a
lack of general knowledge & put forward a pointless example. If you want
people to take you seriously, point out the typos, correct errors in coding
not style, try not to comment on with statements like "Absurd". Your
statements in light of how many judgement errors you made seem pretty shallow.
I'm willing to stop this right now, but try to act a little civilized.
Absurdly, regards
Rick

Source record: 88407

Blair Bingham (bbingham@turbo.KEAN.EDU) wrote:
: Hello, I have a couple questions about page-flipping in games.
: Excuse me if I phrase this stuff awkwardly :)

: 1. How neccessary is it to page flip? (might be a stupid question)

Lets say you have a 'build screen' routine that takes about 75% of a frame
time (1/50 of a sec). This routine does not fill the screen from top to bottom,
but from bottom to top, or at random spots of the screen.

If no page flipping is used, and the display is started (with the top scanline),
your routine will not have finished with the screen data of this scanline, and
stuff will be messy.

: 2. Let's say your program is small. As I understand it as Antic is
: drawing the screen, your program is excecuting. Should you use VBI or
: whatever to control flips, to avoid switching pages in midst of Antic's
: drawing?

The vertical blank is the place to do page flipping; the VBI is ideal!

: Thanks!

2681. Help: Atari 800 serial port pinout

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-12 00:00:00 UTC
From: bjb@rain.org
Message-ID: <434cea$7cc@news.rain.org>
Source record: 88408

Am in process of converting from an Atari program that drives a weaving loom to a PC program that does same (ProWeave). Atari cable to loom controller plugs into port 1 on front-left of the 800. Loom end is an RS-232 (DB-25 male) with pins at only 1, 2, 3, 12, 14, 15 positions.

Need to know the logic pinout of Atari port 1 in order to construct proper cable from PC serial port (COM2) to loom controller.

Any help will be deeply appreciated. Please reply e-mail to bjb@rain.org.
Thanks,

Ben

Take a look at:

http://pmwww.cs.vu.nl/home/ipoorten/Atari.8bit.Homepage/Pinouts.html

also, keep in mind that the Atari 800 serial port doesn't use RS232 signals,
but TTL style.

Ivo

2683. ATARI/COLECO/C64/FAIRCHILD/INTV/ODY2/TI AUCTION UPDATE #2

ATARI/COLECO/C64/FAIRCHILD/INTV/ODY2/TI AUCTION UPDATE #2

I am posting this auction here because I believe that some
people who read this newsgroup are interested. Here is the
order of the items in this auction. There are several
very good cartridges in this auction, so please
take the time to look through this auction for things
you might want and then send me a bid on those items.

TO ALL COMPUSERVE BIDDERS...ALL EMAIL I KEEP SENDING YOU IS BEING
RETURNED TO ME
FOR SOME REASON...

HERE IS THE ORDER:

ATARI 2600
ATARI 5200
ATARI 7800
ATARI 400/800
ATARI MISCELLANEOUS
COLECOVISION
COLECO ADAM
COMMODORE 64
FAIRCHILD
INTELLIVISION
ODYSSEY2
TEXAS INSTRUMENTS 99/4A
MISC SYSTEMS

This Auction will end at Midnight Mountain Time on
SUNDAY, SEPTEMBER 17, 1995 unless bidding is
still strong.

Atari 2600 cart�s are all preceded by their VGR rarity
rating.

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

I will
not guarantee that I find them. Shipping will vary depending on the system.
MINIMUM BID INCREMENTS FOR ALL OF THE SYSTEMS WILL BE $1

-Colecovision/Adam Controllers: White

-Coleco Adam Computer: CPU, Keyboard & Controllers $7.00 perryd

-Nintendo Control Deck: 1 controller & rf switch $5.00 rhett

-Intellivision II w/ Atari System Changer $8.00 rhett
no cables

-Atari Keyboard Controller

TRADES:

HERE ARE THE RULES:

1. This auction will end on Sunday, September 17, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: james.manazer@m.cc.utah.edu

I remember that there was a disk drive mechanism that could be used as
a replacement for the INDUS-GT. When installing it, you had to cut a
couple of traces on the board, and Synchromesh would never work again, but
it was some type of stock mechanism. There was an article on how to do it
in one of the ATARI club newsletters from days of yore. It was one of
those articles like the Bucholtz(sp?) 265K upgrade. Since I never owned an
INDUS drive, I am not sure I ever saved the article. If the logic board is
still good, you might be able to replace the mechanism....

2686. Re: Atari 8bit Opcodes!

#==========Ted Skrecky, 9/7/95==========
#
#
#The following is from the February 1988 issue of KEEPING PACE:
#
#BNR - Branch for No Reason.
#CMD - Create Meaningless Data.
#DRA - Decrement Random Address.
#EDR - Emit Deadly Radiation.
#LLI - Lose Last Instruction.
#PRS - Push Results off Stack.
#RIS - Remain In Subroutine.
#SHB - Scramble High order Bit.
#TEC - Take Extra time for Calculation.

Thanks Ted. Those are good ones and worth keeping. Humor seems to be
lacking these days in the computer groups.

#==========Michael Current, 9/8/95==========
#
#>I heard FTE is selling SpartaDOS X? How can I get in contact
#with them? If
#>not, does someone want to sell theirs?
#
#Fine Tooned Engineering's SDX is sold by a number of 8-bit Atari vendors,
#including B&C ComputerVisions and Computer Software Services.
#
#Fine Tooned Engineering
#P.O. Box 31270
#Mesa, AZ 85275
#United States
#tel: (408) Get-REAL {438-7325} [Orders] (OLD??)
#BBS: (408) 438-6775 (OLD??)

This has to definitely be an old number since 408 is the area code
for the San Jose area.

The area code for Arizona is 602. Does anyone have the new number
for Mike? The last message I saw from him was when he had moved
but not gotten a new phone number yet. Haven't seen anything since.

Naw, the standard Atari 1050 Mech will work but you have to figure
out the correct Plugs to the Jacks and do a little messing with the motor power
wires. I did it way back, about 1986 or so. Sent American Technivision a
sheet on how to do it and I think posted it on GEine and CServe.

Ever since I upgraded to a new Pentium 120, the sound on my Atari
XFormer emulator is severely distorted. This is the only program that
I have had this sort of problem with. It occurs under both DOS 6.2
and Windows 95. Any suggestions??

ATARI/COLECO/C64/FAIRCHILD/INTV/ODY2/TI AUCTION UPDATE #1

I am posting this auction here because I believe that some
people who read this newsgroup are interested. Here is the
order of the items in this auction. There are several
very good cartridges in this auction, so please
take the time to look through this auction for things
you might want and then send me a bid on those items.

HERE IS THE ORDER:

ATARI 2600
ATARI 5200
ATARI 7800
ATARI 400/800
ATARI MISCELLANEOUS
COLECOVISION
COLECO ADAM
COMMODORE 64
FAIRCHILD
INTELLIVISION
ODYSSEY2
TEXAS INSTRUMENTS 99/4A
MISC SYSTEMS

This Auction will end at Midnight Mountain Time on
SUNDAY, SEPTEMBER 17, 1995 unless bidding is
still strong.

Atari 2600 cartUs are all preceded by their VGR rarity
rating.

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

no cables

-Atari Keyboard Controller

TRADES:

I will be willing to trade for Sega Saturn stuff, 2600 Berenstain
Bears and other ER and UR carts....

HERE ARE THE RULES:

1. This auction will end on Sunday, September 17, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: james.manazer@m.cc.utah.edu

2697. FS/T: Classic computer equipment [09/12/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-12 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <433r15$58m@ixnews2.ix.netcom.com>
Source record: 88602
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy,comp.sys.ti

NOTE
This list now includes cartridge based software, as well as hardware.

updated 09/12/95

I have the following Classic computer equipment for sale or trade.
The list includes software and hardware from Atari, Commodore,
Radio Shack, and Texas Instruments.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Snail. The shipping cost
depends on both the weight of the package and the distance that it
is traveling. Buyer has the choice of either first class or parcel
post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 7.50 ATARIWRITER
$ 7.50 BASIC
$ 6.00 GALAXIAN
$ 9.00 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

*****

COMMODORE 64 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 9.00 FAST LOAD (Epyx)
$ 7.50 FROGGER (Parker Brothers)
$ 5.00 JUPITER LANDER
$ 5.00 KICKMAN
$ 5.00 MAGIC DESK I
$ 5.00 MUSIC COMPOSER
$ 6.00 OMEGA RACE
$ 5.00 SPEED/BINGO MATH

Complete cartridges. With box, and manual:
$ 7.00 KICKMAN

*****

COMMODORE VIC-20 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 5.00 ADVENTURE LAND (#1914)
$ 5.00 ALIEN (#1906)
$ 5.00 AVENGER (#1901)
$ 5.00 GORF (#1923)
$ 5.00 OMEGA RACE (#1924)
$ 7.50 Q*BERT (Parker Brothers)
$ 4.00 RADAR RAT RACE (#1910) -- no label
$ 4.00 SPEED MATH / BINGO MATH (#1933)
$ 5.00 THE COUNT (#1917)

Loose cartridges with manual. No box:
$ 5.00 COSMIC CRUNCHER (#1922)

*****

TEXAS INSTRUMENTS (TI 99/4A) COMPUTER:

Loose cartridges, no box or manual:
$ 4.00 ADVENTURE
$ 4.00 BEGINNING GRAMMAR
$ 4.00 BLASTO
$ 4.00 CAR WARS
$ 4.00 CHISHOLM TRAIL
$ 4.00 HOME FINANCIAL DECISIONS
$ 4.00 HOUSEHOLD BUDGET MANAGEMENT
$ 4.00 HUNT THE WUMPUS
$ 7.50 JAWBREAKER II (Sierra On-Line)
$ 4.00 MUNCH MAN
$ 4.00 PARSEC
$ 7.50 PROTECTOR (Atari)
$ 4.00 TI INVADERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER with box, User's Guide (175 pgs.), power
supply, and RCA cable.

I will also throw in a second non-working COMMODORE 64 for parts,
FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #8

COMMODORE 1541 DISK DRIVE with power cord, and serial cable.

$25.00

*****

LOT #9

COMMODORE 1541 DISK DRIVE.

Power cord and serial cable are available from Radio Shack for
around $11.

$20.00

*****

LOT #10

NEW RF SWITCHBOX PURCHASE OPTION

RADIO SHACK COLOR COMPUTER with RCA cable, built-in power cord, and
built-in BASIC.

This is a complete system, except for RF switchbox.

$14.00

*****

LOT #11

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF
switchbox, Beginner's BASIC (150 pgs.), and one function key strip
(for keyboard).

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to use.

$25.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video
game systems and/or cartridges in trade towards any of these items.
Systems I am interested in include, but are not limited to, the
following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need Atari color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need TI color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking
for now is software (primarily cartridge based).

Please send a list of what you have, and please be specific (indicate whether or not cartridges and/or systems include the box and/or instruction manual). Please mention any controllers that are included.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

2698. Barbarian !!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-12 00:00:00 UTC
From: i17879@caravela.di.fc.ul.pt
Message-ID: <4343ac$j8g@master.di.fc.ul.pt>
Source record: 88603

I wonder if someone as the game
Barbarian (Psygnosis) for traid .....:)

It's a game that is in my mind since
I bought my Atari ..... (a long time ago ....)

If anybody as the game please tell me !

Thanks !

I may be mistaken, but, I don't think Psygnosis ever published
Barbarian or any of their other titles for the 8 bit. If you're
looking for ST versions you might try comp.sys.atari.st

2702. Atari 800XL Computer and Assessories

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-13 00:00:00 UTC
From: AFFZ82A@prodigy.com

I am reposting this add as I do have an Atari 800XL computer with 2 joy sticks, a cassette recorder, two 1050 disk drives, a numbers unit to enter numbers more easily, and lots of kids software. Also two remote joysticks and remote control unit...Selling as an entire package...Will list all the items when I can take a total inventory of what I have...I will list it here soon.

>;TWO BYTES LONG (the second is ignored).
>
>You know, I think you just possibly will be corrected about this by more
>people then myself.

Yes, I will correct this.

Steve, there is most definitely a bug in the 6502 chip that causes the BRK instruction to abort if another interrupt source is received at the same time. The interrupt will get processed, but the BRK will never pass control through the IRQ vector, and will simply return to PC+2 as if the BRK never happened. I've proved this, and the bug has been described in documentation for the 65C02 and 65816 processors, which don't have this problem.

Though more obscure, I've also proved that the 6502 can skip both NMI's and other IRQ's in a similar manner. I have not seen this bug documented, however it is also fixed in the design of the 65816 chip.

2706. SIO2PC: ANY BUILDERS/SELLERS OUT THERE?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-13 00:00:00 UTC
From: tatkins@unix1.sncc.lsu.edu
Message-ID: <436nr7$2amh@unix1.sncc.lsu.edu>
Source record: 88428

I could probably get the file sio2pc and try to interpret a schematic
from an ascii file and buy the parts (around $13 total) and put one
together. I am just wondering if someone experienced in building them
would be willing to do so and sell them. Or at least sell me one. Ok,
how much? Gee, a person could get rich on these things.

> - If so, how is it done (what special hardware/software is required).
> - What copyright issues are involved? (Is it OK if you destroy the
> original cartridge after doing this and only use the ROM image on
> one computer at a time?)

Yes, people around here know how to make copies of cartridges, but I'm not one of them. :)

Copyright law permits making a copy of commercial software for your own personal use. (Think about it-- just running disk or cassette based programs requires copying them into RAM, and the law actually takes that into account.)

So if you already own a program on cart (or disk, or cassette), and you want to make a copy for running on your other machine, or for archival purposes, you're completely within the law.

If you then go on and distribute copies of commercial software to other people, _now_ you're talking software piracy.

2708. Re: Lots and lots of sprites

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-13 00:00:00 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <145431@cup.portal.com>
Source record: 88430

JF; well I'm in an opinionated mood<g>. The way most programers seem to have made it into the Atari Hall of Fame with moving objects is character mode graphics with P/M. Frogger is a good example. All the logs & Aligators are character based graphics. Ditto for most of the back ground. In order to scroll these smoothly the programs take advantage of the hardware scrolling. That's way there is a smooth one pixel movement in the river. The GR.(12) mode gives you the same resolution as the GR.(15) & does it with 4 colors + background. Throw in the P/M graphics with the extra colors it brings to the screen & it makes for a very nice display without even if you don't switch colors on the fly. I'm a fan of programs/programers that really know how to tweek the hardware like this. Other then Chuckles who did most of his famous stuff like Ultima(s) & Caverns of Calisto in GR.(24), I'm not that impressed with most of the programs that came out in bit mapped modes, at least as far as the grahics are concerned. You can write a great game no matter what mode you're in, but they just seem to look better if play to the strengths of the machine.
Rick

2709. Re: Alternate Reality ?

Newsgroup: comp.sys.atari.8bit

|> game. The problem is that one disk has crashed.
|>
|> Can someone send me this nice game or know where I can find.
|> I guess it's impossible to buy it, since it is very old.
|>

I just received an order from American Techna Vision a couple of weeks ago which included both AR:The Dungeon and AR:The City. These are available for only US$5 apiece, although the shipping costs to Sweden might be prohibitive.

You can get a copy of ATV's catalog by sending email with your name and postal address to ATV's owner, Ralph Maddox, at rmax99@ix.netcom.com.

I haven't yet booted either of the AR's but I've been playing with both Gauntlet and Hacker over the past few days (also purchased from ATV).

I don't seem to have nearly enough time to work with my Ataris lately. In light of the discussions recently (with Joe Walsh et.al.) I'm almost embarrassed to say how long it had been since I'd booted my 800XL.

2710. ATARI Equipmnet MUST SELL!!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-13 00:00:00 UTC
From: Terry Ortman <102603.2652@CompuServe.COM>
Message-ID: <437bir$j5t$1@mhadg.production.compuserve.com>
Source record: 88432

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $100.00 or best offer.

ATR8000 64K CP/M computer, for use with Atari 8-bit computers or Dumb (IBM computer) terminals. Runs all CP/M 2.2 software, supports up to 4 disk drives, any size, any density, 8 inch, High Denisty 5.25 and 3.5 floppies, any IBM compatible printer, modem port for using any RS232C compatible external modem, includes Auto-Term Disk for Atari computers, CP/M 2.2 Master Diskette, several CP/M disks, ATR8000 Manual, MY-DOS master Disk, CP/M Supplement Manual, modem cable, printer cable, original cost $695.00 for the ATR8000 Basic system, printer cable $39.95, Modem cable $39.95, asking $125.00.

Dual Floppy Disk Drives in case with power supply and cooling fan, connecting cable, for above ATR8000 or any IBM compatible computer. Case can hold 4 half height 5.25 floppies, original cost $895.00, Case alone is worth $89.95 at most supply companies, asking $85.00.

BOTH ATR8000 & Dual Floppies in case, $150.00.

ATR8000, as above, only with Co-Power 88 installed. I bought this from a guy for $375.00, does NOT have the Co-Power 88 Boot Disk, needs a copy. The guy who said he was going to send me a copy never did. Need to recover my loss on this unit.....$350.00

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes manual, power supply, original cost $179.95, asking $75.00.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $175.00 for the entire package.

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Send all inquiries/offers to: admiral@freebbs.com via Internet E-Mail,
or E-Mail reply to this, all serious offers will be considered! Will
also consider trading for IBM computer (80386SX at least).

ATARI/COLECO/C64/FAIRCHILD/INTV/ODY2/TI AUCTION UPDATE #3

I am posting this auction here because I believe that some
people who read this newsgroup are interested. Here is the
order of the items in this auction. There are several
very good cartridges in this auction, so please
take the time to look through this auction for things
you might want and then send me a bid on those items.

TO ALL COMPUSERVE BIDDERS...ALL EMAIL I KEEP SENDING YOU IS BEING
RETURNED TO ME
FOR SOME REASON...

HERE IS THE ORDER:

ATARI 2600
ATARI 5200
ATARI 7800
ATARI 400/800
ATARI MISCELLANEOUS
COLECOVISION
COLECO ADAM
COMMODORE 64
FAIRCHILD
INTELLIVISION
ODYSSEY2
TEXAS INSTRUMENTS 99/4A
MISC SYSTEMS

This Auction will end at Midnight Mountain Time on
SUNDAY, SEPTEMBER 17, 1995 unless bidding is
still strong.

Atari 2600 carts are all preceded by their VGR rarity
rating.

The Rules follow this auction.

Please send all bids to jrm8248@u.cc.utah.edu

Happy Bidding!!

-Atari Keyboard Controller

TRADES:

I am looking for R/ER/UR carts and a few U&#65533;s too...

HERE ARE THE RULES:

1. This auction will end on Sunday, September 17, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: jrm8248@u.cc.utah.edu

The Tramiel family was long gone so they can't be blamed for Commodore's
problems. It's just difficult to sell a proprietary system that only one
company manufactures and distributes when it goes against the PC juggernaut.
Apple isn't doing too well now either (though compared to Atari and Commodore,
it's still fantastic)...

Hmmmm ..... that seems to work on .atr files with only one game in them,
but what about .dcm files which I've converted to .atr format - how do I
load these individual games? (they give a listing of corrupted filenames).

Also, on a different matter - I have gauntlet, but when I try and load
it, it prompts for disk 2 - how do I get around this please?

Thanks,
Phil

It does support GTIA modes. In fact, the Atari Logo that appears when you first turn on the system was probably created using GTIA. The 5200 is really a fancy Atari 400 with minor modifications to allow use of the analog joysticks, etc. (but you gotta LOVE those game machines with the stainless steel strip accross the case; now THAT's art).

>Frogger is a good example.

There are lots of good examples, so thanks for using mine. :-)

PMG redefinition is the way to go, and is also a lot of fun IMO. And I don't understand your problems about DLIs, since you really can do quite a bit of work per line. Make sure you pre-load registers before doing the first STA $D40A.

A really challenging feat, is to provide multi-color players using only one PMG and DLI routines to change colors vertically at different points in the player. This is really difficult in text based modes, where you only have 17 cycles on the top scanline of each line of text. I was still able to get color changes for two players processed, as used in the game Bankster. (This game didn't need redefinable players, but could have used them).

I will put my 2 cents in here to Steve on this. I have the 1st copy of
APE104 and although I haven't had a chance to use it, I will say that no
matter what someone says. You will always have some clown who will come
along and complain one way or the other about something. No matter how
good it is or what you try to do for them. Its just their nature to be a
pain in the rear. Instead of complaining, you should be praising the guy
for taking the time to develope something you might be able to use. To
those clowns all I can say is get a life and grow up. To Steve, Keep up
the good work and ignore the few who act that childish. Take care.

What is it with those two companies, once the top in home and gamecomputers. Now it's mostly japanees. I have got an Atari 2600 & 800 XL, C64, Amiga 600 and CD32.
ATARI is not going verry well and the remainings of CBM just bought bij the german Escom. (I am typing this e-mail with an Escom PC).
I don't like the Nintendo's Sega's and Sony's (just for kids), or am i only a bit nostalgic, because when i was stil 17 it were the days of the Atari 2600 and the CBM 64 ???

greatings Rob.

What I've been working on is a system where you can plot multiple incarnations
of a player to the screen through a subroutine which automatically handles
which DLIs to notify of the horiz. position and colour changes. The problem
I found is that if you try to set the bits'n'bobs of all players & missiles
it's a bit too much for the DLI - especially with Antic DMAing the screen
for the PM graphics. The DLI instructions get smeared over several scan
lines which means my program must acknowledge that a DLI zone boundary
is fuzzy. I can work out a routine to do this, but I just get worried
that too many cycles are being eaten up by all the DLI work and my
calculations to ensure the correct regions are notified of the correct
horiz/colour (maybe size too).
I want a routine where things can move fairly freely - the only restriction
being that a DLI zone can only be used once for a given player.
This may sound a bit odd but I have a particular game application in mind
which I've been working on for some time.

>A really challenging feat, is to provide multi-color players using only

A nice idea; this means moving DLIs (or at least informing other DLIs of the
approaching player) if your players move vertically substantially and I
don't even want to think about that with all my multiple-players...

Hmmm..
I think I'd like to take issue with that comment. Not that I don't hear what you're saying, across the Internet (especially Usenet) there are a lot of fractious users. What I think you are missing is that there a LOT of them. There are, IMO, a core group of Mac users (and respective, a core group of DOS and Windows users too) who are NOT bickering and fragmented. It's the sheer numbers which end up dragging us down. Every tom, dick, harry, jane, sue and mary can own a pc nowadays, with prices and such being what they are. In the days of the original TI/Atari/TRS-80/AppleII computers, computers were not for just anyone. More money was required, and more dedication, and more skill in learning the art of using them. The users who had one or more of those computers who have either moved on or gotten one of the newer generation of computers (like myself) still feel good about using them, and I feel I'm part of a cohesive Macintosh community. Unfortunately, I do feel you're correct to a degree, there are a lot of flameheads out there.... but let's not forget the mitigating factors.

Want to hear something even more embarassing? About three weeks
ago, I received an order from American TechnaVision consisting of 25
different titles. How many did I play? One. Sure, I tried the others
out, but that one (Decision in the Desert, by Sid Meier) was /so/ good,
I couldn't get past it! :) I was at a forum for part of this week, and
haven't booted my Atari in a few days, but I am hoping to have time this
weekend to check out the other 24 titles in-depth. :)

For those of you who need your Atari 8-bit disks converted, I offer a service to do this. Prices are $10 for up to 50 disk sides (double sided 'flippies' count as 2) and $20 up to 100 disk sides. More than 100, call or write for a quote. Return shipping is $3. You will be sent 3.5" 1.44MB PC disks with your converted disks in the PCXformer & SIO2PC format. We also have a catalog of software that has already been converted & checked out to run with the PC Xformer, and the AVD shell which is a DOS application to help you manage your virtual disk files.

>since.

I know the feeling -- as do many of us. Fortunately, many of us
return to the fold after realizing our errors. :)

I sometimes think about the woman I sold my Atari 1200XL system to
'way back in 86 (at the time, I thought the Apple //c was /the/ computer to
use--one in a string of mistakes of going with what was popular rather
than with what I knew I liked). It was a 1200XL, 1050, 1010, Okimate-10,
AtariWriter (original cart), and a bunch of games she didn't want but
which I insisted she take. See, she was living about 50 miles away in
San Francisco, and she was a budding writer. She figured computers
was the way to go, and the system I had was being sold for $200, so what
they hey? Welp, over the next several weeks I kept getting calls from her
(me, a 13 or 14 year old kid, she a thirtysomething writer) asking how
the heck to do A or B. The first time it was how to save a file...she
hadn't loaded DOS, so that was prolematical from a disk standpoint (I
ended up telling her to save it to casette (which she had no blanks of
on hand), reload AtariWriter /with/ a DOs disk in the drive, then load
the file from cassette and save it to disk. Other problems followed
on a too-frequent basis. That rediculously-low $200 (at the time) for
the system was EASILY eaten up in "consultant" fees. :)
Anyway, I sometimes wonder whether she ever figured out how
to "do" computers. Her calls eventually stopped, with no real thanks
or anything (I got the impression she blamed the problems she was having
on me - that "I can't save the file" problem she even said was because
I had sold her a broken disk drive, at first - dunno whether she went
out and got a cassette, or what, but she never did mention that again,
neither to tell me she got the drive to work nor to say she was sorry
for accusing me of selling her borken equipment - and I never asked,
being a pretty shy kid).
Who knows - maybe she wrote some big-selling book and it was all
thanks to me, the computer I sold her, and the free telephone support I
gave her after the sale. :)

>idea it is.

Mmmm. I dunno what era anyone else was talking about, but I
was pretty much sticking to pre-Atari/Commodore price wars when speaking
about the computer industry in general. Back then, prices for setups
similar to today's typical PC package (computer, disk drive, monitor,
printer - let alone an interface and modem) were indeed about what they
are now (although you get more power/storage/etc. for the same money).
Heck, let me take that back - let's just go with typical setup - computer
,disk drive and printer ALONe cost you as much as you pay for a computer
(with hard drive, RAM, and floppy) with a color inkjet printer, modem,
etc. (today's typical setup) now.
Of course, when talking about population size problems, in the
case of Atari (dunno about Commodore) the price wars didn't increase problems
for us much. Sure, there was a greater population of /owners/, but the
population of long-term /users/ stayed pretty much the same, I think. Lots
of folks bought those $100-$200 computers back then, set them up, found out
you had to /work/ in order to do anything useful with them, and put them
in their closets never to be seen again (until Garage Sale time, anyway).
Heck, I remember my mom coming home from work and telling me how excited
people were that Value Giant (a local drugstore/discount retailer) had
Timex/Sinclairs (or was it TI 99/4a's?) for $50. Of those that bought
those computers, I would be surprised if even 1% kept at it for more than
a month.
Not so with Apple //, of course. Those suckers stayed up there
in price forever. people that bought them had a commitment to use them -
who pays $2000 for something then relegates it to a closet? So, in that
case, as purchases increased, the population troubles also increased.
Those troubles still exist among those who use Apple]['s (or //'s) these
days.
It's similar with IBM/Clone and Mac populations, of course.

>Atari 400 with minor modifications to allow use of the analog joysticks, etc. (but you
>gotta LOVE those game machines with the stainless steel strip accross the case;
>now THAT's art).

I got a 5200 when they first came out, and loved it (this was before
I discovered the Atari 400 ('bout 2 months before, tops)). I recently
sold my 5200 collection, though (who needs it when you've got the 8-bit
computer?).
Anyway, regarding your comment on the stainless steel strip, I liked
that, too - it's a nice touch. The whacky thing about the 5200, I thought,
was that here they designed this HUGE base unit with cubyholes for the
sticks and a place to wrap the power/TV cord so you could have it occupy
as little space as possible. Huh? Make it huge..yeah, okay, going with
the concept of bigger is better...then try to make it take up less space?
Huh? Wouldn't it have been more logical to make the unit itself as
small as possible, assume the user is gonna leave the darned power/TV cord
attached to the TV (that's what those switchboxes are for, after all), and
let the joysticks fall where they may? That's the kind of whackiness that
is indearing and frustrating about Atari (whether Inc. or Corp.). :)

You checked all around town and couldn't find *any* Atari compatible joysticks? If you can't find them at any stores (ala Computertime), then my next suggestion would be to check out the local thrift/goodwill stores. They've often got a whole section of computer equipment. I used to pick the Atari stuff clean from the Deseret Industries Thrift Shop on Auburn just West of Watt.

Oh, and BTW, "Hi!"

>of a player to the screen through a subroutine which automatically handles
>which DLIs to notify of the horiz. position and colour changes.

Here's a few hints.

It sounds like your DLI routines are doing too much of the work. It's difficult to find the time for comparisons and decisions within the DLI, when those cycles could be better spent just stuffing hardware. Consider creating a modifyable DLI structure where all of the maintenance work is either in VBlank, or in the program's move logic itself. Turn DLI's on only where they're needed, (saves a comparison for "do I need to do anything") and have something like a linked structure or an index from VCOUNT into tables to pick the data and locations that need to be stuffed. You can stick the data in A, the location in X, and do a STA $D000,X.

Are you using a character-based or bitmap graphic background?

Best of luck with what you're working on.

Thank you for the note about Frogger.

Ahhh...got my registered Rainbow disk from Chris, using the X-Former ROMS (illegal or not, I don't currently have an 850 yet, it's waiting at the PO for me to pick it up, and I am TOO impatient to get it and the cable up and running for the present..)
and it rocks! Whooohoooo! Spy Hunter on my Powermac 9500!
ehehehehehehe.. complete with sound (a little tinny, if I may say so, but all there!).

I went to one of the 8bit WWW home pages, and found a list of FTP archives, it seemed to be pretty out of date. Any idea of the most recent up to date Atari 8 bit archives?? (other than the one at umich, I mean?)

I can't WAIT to get my 850 and cable up and running and transfer all my games and programs to my 9500. It's great to have directory for rainbow that takes up only 700K and has lots of cool stuff in it! :)

I agree with everything you said. As I feared, I wrote that post
poorly. But, in fact, what you are saying is what was on my mind as I
wrote it. Once it gets beyond the hard-core users, you start to have
problems. Any population increases, problems magnify, multiply, and
mutate at a rate far beyond the population growth rate. This is true of
computer users, car enthusiasts, and city, country, or world populations.

Well, I think that the Atari and Commodore generation of Video Games
just totally smoked our current Nintendo/Sega generation.
Oh, sure, today's video games have flashier graphics and sounds, but
they are all the same! Where's the creativity? How many bloddy Super
Mario Bros and Street Fighter clones do you want? I swear I could count
all the different types of video games around now ON ONE HAND.
At least in my day (boy do I feel old) every single video game was
different. I mean totally different, NOT just new graphics and different
characters/weapons. Every game was its own type! In those days every
game was a creative masterpiece.
And they were fun too. Unlike todays games where you die and have to
start all the way over at the beginning. All you do is repeat the same
thing (level 1 or whatever) over and over and over and over again.
Sure's hell ain't my idea of fun. Then eventually, if you don't take a
sledgehammer to the damn thing, you win the game. Now what? Your $60
toy is no longer any fun and its time to go buy another. At least the
games of yesteryear could be played many times before they became boring.
What happend to skill? Todays games require very little skill. If
you can press the button really fast, you win. If you can learn these
intricate, precise patterns (combos) you win. If you have a strategic
mind and skill, your SO!!!

Here Here!

The saddest part of the SNES/Genesis/etc is this: they more than have the capability to duplicate the old and fun arcade games of the past. Whereas we, this "old video-game generation(all of about in our mid-20's)", had to put up with limited arcade reproductions.

It is such a shame! That amidst all of these me-too games of mortal combat and else, the old arcade classics are just sitting out there.

I would have to say that many of us fondly remember those old games. And wished when they would come home in a true and faithful version.

For Pete's sake! The technology and power to do this, is so readily available, and so doggone cheap! And, the market IS out there for such games.

Remember when 4k!!!!!!!!!! carts used to cost $25.00??????????? Nowadays they have 4 Mbit(512k-nice marketing ploy) carts for the same price!

I'd say that there is definitely a market for the "ole reliables!"

Take care and God Bless!

>Are you using a character-based or bitmap graphic background?
>

I think you've put forward what I've actually been working on.
I split the screen up into specific zones using DLIs (this is a
character-based mode):

```
VBI.......................
Zone 1
DLI.......................
Zone 2
DLI.......................
Zone 3
.......................END OF SCREEN
```

When my program says "move sprite S down" it checks where S is and
sends the appropriate image data to the VBI for drawing in the correct
position and sends the horiz/colour/size data to a graphics buffer.
The DLIs read off this buffer in an appropriate way i.e. LDA COLOUR0,X
STA PCOLR0,X. The only thing is that because I read lots and write
lots during a DLI, the DLI itself stretches over several scan lines,
so I have to more careful about telling which DLIs to do what (in
general you'll have to send data to two DLIs at once anyway when
moving a sprite over a DLI). An alternative is to get the
DLI to write to it's own instructions so that immediate
addressing is used which is a lot quicker than LDA abs,x but
that in itself takes up time. My game has a lot to think about

as well as DLI data.

I also get the VBI to shadow the buffer to make sure it doesn't cause messy graphics flicker. My routine isn't functional as yet but it looks promising. It's the speed that worries me. With all this stuff going on I don't want it to grind to a halt and I'll only know for sure when I put game mechanics into practice, too. The routine is designed for an arbitrary screen splitting, so it's very reusable.

(DLIs, VBIs and PMG can steal quite a lot of cycles from the 6502 and with the program going "where should I put this sprite" every time something moves... I just want to be safe that's all!)

Anyway I hope you can see what I'm doing now. It's all programmed in an objected-oriented style.

;and running for the present..)
;and it rocks! Whooohoooo! Spy Hunter on my Powermac 9500!
;ehehehehehehe.. complete with sound (a little tinny, if I may say so, but
;all there!).

Glad to see it runs okay on a 604 PPC machine; I'm waiting for Aston to
get one :)

I know the Rainbow sound on a PowerMac may sound like it's vibrating at times.
This is due to 8bit software poking the frequency channels very rapidly and
because it's so fast on a PMac, the sound may warble a bit. I didn't notice
the 'effect' on a 040 machine.

;I can't WAIT to get my 850 and cable up and running and transfer all my
;games and programs to my 9500. It's great to have directory for rainbow
;that takes up only 700K and has lots of cool stuff in it! :)

Let me know if you have success (or otherwise) with the transfer software.

Chris.

yeah. I noticed since I sent you email last time that if I change the
refresh TV thing menu (can't remember the offical name...) to different
settings the sound changes too, gets a little 'slower' which is good. I'm
working on experimenting with what is best.

I wouldn't say poorly.. you just hurt my feelings with the Macintosh user comment. :)

Yeah.. I think the problem is one that relates to how many and what types of people can now afford computers, regardless of the 'scale' of costs (this refers to the previous post that responded to my post..) It's different now.

To prove your point, you would I'm sure have a fit reading how much we're (mac users) currently complaining about Apple screwing us over with the release of the new networking software (Open Transport) on the new Macs... It's about as divisive a conversation as one can have and still remain friendly with other mac users. I am involved, and usually I try NOT to be involved in such things for the very reasons you mentioned (i.e. look what we DO have, compared to some other users...)

James Hague (junkster@coho.halcyon.com) wrote:
: Another possibility is to dynamically redefine characters to simulate
: sprites.

: frame. It looks like Shamus did something like this, but I can't confirm it.

Shamus did use this technique. You'll notice that the bad guys never move diagonally; doing so would have required too many redefined characters to handle the diagonal movement. Instead, they move vertically and horizontally. (I used other techniques to verify that Shamus used character graphics, like twiddling the CHBASE register after the game was loaded, via a custom OS patch on my XL.)

The game "Drop Zone" (I think that's what it's called) also used this technique, but for extremely small "sprites" (4x8, I believe), thereby allowing for diagonal movement.

I once wrote a demo moving around several asteroids on the screen using redefined characters. It was kind of flickery, and only monochrome, but depending on your app this may be okay.

I'm an avid user of Darek Mihocka's Xformer. Used to have a 65XE and an Atari 800 clunker, but I sold them off years ago.

Still have some software but I run into copy protection when I try to run the XFD files. If there's a good samaritan with working xfds, atrs, or dcms of Fractalus, AR the City, Temple of Apshai Trilogy, Return of Heracles, Canyon Climber, or Flight Simulator could you forward them to me puhleeze...

Was there ever a mouse driven interface devised for the 8bit?
I _know_ there was a command line interface at one time does anyone know where I might find this?

Thanks, -Daniel

Not entirely true...the games we like just don't get the advertising or
the glossy poster in the store! A good number of SSI, Origin and other
RPG, strategy, and classic games have been released for the newer systems
too. M.U.L.E. is available for the NES.

But I still give my 130XE, 2600, 5200, 7800 and Amiga equal play time. :-)
It's true that when you grow up with a system, it grows on you.

I do think that the Atari is alot more fun to write for...you always got a
sense of accomplishment after hacking together something crazy that looked
neat, and was optimized down the last clock cycle.

Today it would be impossible for one (or two) people to put together a
game and have it be a big success. Atari's development policy for the Jag
is probably the most open in the industry, you practically have to give
your soul away to write for Nintendo.

But I digress....

>Mario Bros and Street Fighter clones do you want? I swear I could count
>all the different types of video games around now ON ONE HAND.

I agree with what you are saying here. I just saw an ad for some
game or other (the one where the coin-op is cut apart with a chain saw, and
inside is some videogame system playing the cart, thus revealing you can
play this spiffy game at home! whee!) that is simply another Mortal Kombat
clone. Yet, people are apparently getting excited about it.
I look in the current issue of Fusion Magazine (formerly Electronic
Games Magazine) and see nothing but "me, too!" games. It has gone way,
way too far. I own a SNES and I haven't bought a game for it since
Christmas of 1993.

> At least in my day (boy do I feel old) every single video game was
>different. I mean totally different, NOT just new graphics and different
>characters/weapons. Every game was its own type! In those days every
>game was a creative masterpiece.

I disagree. I remember the bazillion Pac-Man clones, the infinite
Space Invaders clones, etc. Game types were done to death back then, too.
And, it isn't true that "every game was a creative masterpiece."
There was lots of chaff, whether you are talking about the home videogame
(2600/Intellivision/Odyssey/Fairchild/ColecoVision/etc.) market or the
home computer market. When I had an Apple //c, I had tons of disks of games,
and about 50% of that was pure crap. Only about 10% were "creative
masterpieces." I still own tons of Atari 8-bit games, and much of that is
crap. The industry churned out crap back then, just as it does now.
The difference is that, back then, a new idea was truly new. It had
never been done before. Further, many of the products that seemed, on the
surface, to be duplicitous were in reality so advanced over what came before
that they were very new and exciting, too. For example, Ulitima took an
old concept (medieval-style adventure game, a la D&D, done on a computer) and
made it highly graphical, very complex, and very replayable.
Even more than that, though, the biggest difference was that
most of the games back then were capable of being played many, many times
without repetition. They had randomness at their soul. Adventure,
for instance, has so much randomization that you can play Level 3 every
day for years and not be bored (I should know; I did it;). Star Raiders
definitely falls into this category, too.

Today, if you've played Link once you never want to play it again.
The puzzles are the same, the monsters are in the same places, etc....
EVERY time you play. There is nothing new left about the game after you
have played it through once. Same thing with the Super Mario Bros. series.
And Sonic. And Bonk. And most games produced today. Instead of using
the advanced processing power and memory to make things even more random,
they use all that to build in more "levels" to explore - STATIC levels.
Sure, the game has 100 levels to beat. But, every time you play level 1
(or 2 or 10 or 59 or whatever) it is the exact same layout, with the same
obstacles and monsters, as the last time you played it.

> What happend to skill? Todays games require very little skill. If
>you can press the button really fast, you win. If you can learn these
>intricate, precise patterns (combos) you win. If you have a strategic
>mind and skill, your SO!!!

Exactly. All today's games require is the memorization of a series
of twitches. Big deal. (Not /all/ of today's games, mind, just the most
popular ones...you have to /hunt/ for good games.)

Just exactly what do you mean by real schematic? I'm looking at a schematic from Radio Electronics & the only real difference is the thing is unwound a little, but it looks almost as esoteric as the ASCII file. Do you want suggested parts placement or something along those lines. I'd really like to know where your are having trouble as you aren't the only one & I certianly wouldn't mind helping to clear up any confusion. Worst case, I could post my ASCII art for a version based on the 74C00. If nothing else, its a lot easier to build & requires fewer parts/connections. I've built about a dozen of them, haven't sold one yet; just gave them away. I don't think I've had more then one fail & the jury's still out on that one.

One of the games I'm most familiar with, Dungeon Lords by Brian Bradley
I believe, had all the snakes, gremlins, whatever done as several
incarnations in a GR.(12) character set. All the 'monsters' were
on a 2X2 layout with incarnations for looking left, looking right, ...
I think the game did have a problem with overlap. Instead of restricting
the movement to a 2 character wide area, he allowed for 1 char/4 pixel
movement. It was fine, but ocasionally two 'monsters' would overlap
& the you would have only half of a character with serious gaps between
him & the forground 'monster'. IMO; it would have been slightly better
graphically if he would have prevented the overlap, but it seems like
he prefered overlap with a ton of attackers to no overlap with just
a few attacking creatures.

I would just like to see someone copy the schematic (the *real* schematic,
if there is one somewhere) to a GIF or JPG file - trying to assemble the
layout from 3 ascii files, or from the pinlist is a real pain... I find myself
doing this again this weekend on a proto-board because the one I soldered up
didn't work. Much easier to find out why on a proto, then I can draw it out &
layout my own board.

Sheesh.

-Atari Keyboard Controller

TRADES:

I am looking for R/ER/UR carts and a few U&#65533;s too...

HERE ARE THE RULES:

1. This auction will end on Sunday, September 17, 1995
at Midnight Mountain Time unless there is still heavy bidding.

2. Current high bids will be posted every other day on this
newsgroup and bidders will most likely be notified when
they are outbid for an item.

3. High bidders will be posted by their email name unless
otherwise specified.

4. When sending a bid, your subject must be AUCTION BID .

5. Minimum bids will be $1 and bidding increments will
be $.50 unless otherwise posted all in US Dollars.

6. If two people bid identical bids, then the person
responding first will get credit for the bid.

7. Shipping will be $2.00 for the first cartridge + $.50
for each additional cartridge. Shipping and handling
for systems will range between $6 and $10.00 depending
on weight. Larger systems may be more. All cartridges
and systems will be shipped through the US Postal
System anywhere in the Continental US. Other areas
will need to make special arrangements for shipping.

8. Following the auction, each bidder will be contacted
individually for payment and shipping. Money Orders
(sorry no personal checks) are the preferred form of
payment, but cash is always accepted. Payment
MUST be received within 7 days.

9. The will be no guarantee or warranty on anything purchased
from this auction. Cartridges have been tested and do work,
unless otherwise specified. Most systems have been tested and
do work. The systems which may not work are the ones without
cables or a power supply.

10. FINALLY, IF YOU ARE THE HIGH BIDDER YOU MUST
PAY FOR YOUR ITEMS, OTHERWISE YOUR POSTMASTER
WILL BE INFORMED AND YOU WILL BE BARRED FROM
FUTURE AUCTIONS!!!

11. I reserve the right to refuse bids.

12. I reserve the right to alter the rules or the auction itself.

Your participation in this auction signifies your consent
to follow these rules as stated.

Send all bids to: jrm8248@u.cc.utah.edu

2770. Atari 800(XL) Emulator on 80386++

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-15 00:00:00 UTC
From: Juergen Buchmueller <0228485758-0001@t-online.de>
Message-ID: <43d2dk$j9b@news00.btx.dtag.de>
Source record: 88542

Hi Folks!
I wrote an Atari-800XL Emulator for PCs and compatibles
and the whole thing works already really fine.. It is
written entirely in 80386 assembler and it would be great,
if someone who's "inside antic & co" could probably finish
this work!? My time is too spare now to continue it..
Some details belonging to display-list interrupts and the
video timing are not correct for every program,
but programs like "Behind Jaggi Lines" or "JumpMan" are
playable on an 80486 33MHz or better.
So, if YOU know enough about 80x86 and 6502 as well,
you probably want to get the sources? I would like to
make them freeware anyway. Eventually someone could tell
me a place, where to upload the whole stuff for everyone?

Besides this I am VERY interested in Disk-Images of the
games M.U.L.E. and Kenndy Approach.

Hope to hear of you (eMail?),
Juergen

2771. building an 850, possible?

Small groups (folks like myself) still make games every once in a while..
and some European companies still make commercial titles.

This isn't the span of EVERYone, but those are the major ones (small, PD or
shareware titles, and then Euro-commercial titles.)

Hello luur!

14 Sep 95 07:59, luur wrote to All:

l> What is it with those two companies, once the top in home and
l> gamecomputers. Now it's mostly japanees. I have got an Atari 2600 & 800 XL,
l> C64, Amiga 600 and CD32. ATARI is not going verry well and the remainings

The main reason is as I think wery easy. The most peaple today who buy homecomputers buy the same machines that they are used to use for ex at work, they buy an bloody PC. And thats the main reason I think wy the companies exploring of sound and Graphics has been the big thing on the "MS-DOS" Compatible side of our world lately. Which one of those costumers want to get back to work and tell there friends there that they bought an f*ck*ng children playmashine like the Atari or an Amiga.??? It doesnt sounds so good to get to work and tell their buddies there that they bought an machine that maybe noone even had heard of.??? They want to have an mashine whith big Mhz power and full compatible whith the machines that evryone at work are familiare whith so they can speak about home computer problems at lunch and coffee breaks.

2781. Q: Any recommended mailorder shop in U.S.?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-16 00:00:00 UTC
From: hog@aqu.bekkoame.or.jp
Message-ID: <19950916.83C1C68.2CD5@aqu.bekkoame.or.jp>
Source record: 88544

Could anyone recommend good mailorder shops in U.S. that are willing
to ship overseas? I have read "vendev" FAQ, but there are so many :)

I am interested in commercial games esp. of Synapse, DataSoft, EA,
Infocom etc., but have to wonder if they are still available...

Followup-To is set to poster, thanks in advance.

> +/- ???
```
The power supply on the connector (board) is:

```
____
- |o o| +
----
```
Also, the output of the PS should be 9V DC @ 1 Amp.

Hope this helps!

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" shareware/freeware/PD developers should also be listed.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, public domain software/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information is given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of the more prominent sources I use. Current Notes magazine, and their 8-Bit Editor Rick Reaser. Atari Classics magazine, published by Jim Hood and Bob Woolley. And The Atari 8-Bit Omnibus, published by David A. Paterson.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

1. Shareware authors are not, in general, professionals, or they
wouldn't be writing shareware.

2. Shareware authors are not paid for their work.

3. The likes of Galaxian, Boulder Dash, Tetris, Breakout, and Snake Byte
make for good training exercises for non-professional programmers.

4. Non-professional programmers do not have the luxury to invest
thousands of man-hours into a project they likely will see no money from.

Starting to fall into place? There's also the "better mousetrap"
theory...if someone says "I love Galaga, but it really needs powerups!",
Accolade and EA will laugh them off, but they can write it and hope to
get $50 in registration fees if it'll make them happy.

I don't see how these can be considered excuses for lack of creativity.
A great many of the classic computer games were written by independant,
part-time programmers who found publishers after they were finished.
This is also how most novels are written; there are few people who
actually write novels full-time. The majority of authors write in their
spare time. This is especially true of not-yet-published authors.

What's even more telling is that there are almost no 1990s clones that
have been superior (or even equal) to the originals. You'd think that
with way fast computers and nifty C compilers someone would be able to
out-do Defender. Yet it rarely happens.

Sometimes, you're right.

Actually, though, from my perspective as an Amiga user, we actually DO
get quite a bit of innovation in the shareware market. While there still
is the like of Deluxe Galaga and N implementations of Boulder Dash, some
remakes are welcome because they were never done (Xenostar-a Sinistar
knockoff), and other creations are quite original...for lack of publishers.

>game was a creative masterpiece.

Not true. There were a rash of Galaxian, Pac-Man, and Donkey Kong knockoffs. There were also a whole lotta just plain bad games. The differences between then and now are that there used to be more "one man show" games and there's a strong tendency nowadays to milk a successful concept for all the money its worth and then some.

I am surprised at how completely derivative and uncreative almost all modern shareware authors are, though. 75% of shareware games are knockoffs of Galaxian (still!), Boulder Dash, Tetris, Breakout, and Snake Byte. Why?

I tried to build the single chip w/diode version from the 3 ascii art files/
pinlist and it worketh not.

So I've dug up the pinlist for the 232/368 version and I'll try to draw that one up -
it just makes it easier for me to debug if I can see the whole scematic at once-
so I know what is going on inside...

And obviously I have no luck deciphering ascii schematics...

But thanks anyway..

7400 version? I'd like to see that...

> internet access account, I am unable to upload at all using rz. I have
> to use rx and upload a file at a time. But, it doesn't truncate.

The problem lies in the difference in protocols. Let's use the standard Xmodem block for an example. When you send a full block of 128 bytes of data, the Atari and the Unix system agree on the header bytes and the data itself. However, when a block with less than 128 bytes is sent (the last block of a file), the two systems disagree on how to handle it. The Atari expects to pad the block out to 128 bytes with a character which represents the number of valid data bytes in the block. So if the last block had 90 bytes of valid data, the Atari would expect a standard Xmodem header followed by 90 bytes of data, followed by 38 bytes of character number 90 [Chr$(90)]. The Unix system expects all non-128 byte blocks to be padded with Control-Z characters [Chr$(90)]. Thus the two systems don't agree on where the end of the file is. This leads to either the last block being truncated, or in an extra pad of characters being added onto the end of the file.

Hmmmm. The ANTIC chip in the 8bit could be classed as this. It halts the processor to refresh
the dynamic memory. I am not sure about how often but i think it is every 8 cycles.

Just wanted to tell everyone who is interested in the status of FTe, etc. etc., that I just received a nice package from them. Upon opening I found a Sweet 16, with the chip, MAE assembler manual and 0.96 version on disk, and another manual for just the 65816 chip.

In addition, Mike also included Vol 1. #2 of "The GET-Real GAZETTE" in which he gives much detail concerning what's really been happening with FTe to include a comprehensive timeline of events at FTe (since its inception), problems he has encountered, philosophies and reasons for supporting the 8-bit and where FTe is going. Yes, the MIO II is still on track, the Mars 8 is "soon" entering production, and SpartaDOS 4.22 and Sweet 16 are shipping!

His Gazette is full of humor, reality, and the trials and tribulations of supporting our 8-bit.

It is a good read!

He even has an inventory price list included.

FTe's latest current address is:

Fine Tooned Engineering
PO Box 31270
Mesa, AZ 85275

Man! The MAX 232 version got mangled in the post to Portal, I'll repost
it just in case it's that way everywhere. Just a few notes on the
7400. Originally I did a one for Bill, he didn't know if his 1200XL had
been modified by jumping the current limiting resistor & I didn't know if
the MAX would run on a stock 1200XL so I built one with a 4049 CMOS chip.
Several people who had said they couldn't find a MAX232 chip then said,
"What's a 4049?" So the 74LS00 was done. Then me thinks, as long as I
don't have a problem getting them, the 74C00 would be a better choice
since it is a low power CMOS version of the 7400 & should work in all
computers. Since then, I've tried the straight 7400, 74HCT00, 74HC00,
& they all seem to work. It all makes sense if you follow the genesis.
The 7400 is a two input NAND gate, that's the reason why two pins are
usually tied together at the input stage. In this schematic, you can see
pins [14 +5V, 13, 12] are tied together. This is an unused gate [13, 12]
being tied to the power supply to prevent oscillation. Richard Dell
correctly pointed out that I was wasting gates in the 4049 design so...
For the last one I made for Bill, I tied this gate to the data line
& have its output lighting an LED.
I seem to have lost the ASCI schematics for the 4049! I think if I had
it all to do over again, I'd switch back to a 4049 since it has 6 inverters
& use LEDs to monitor all the lines. It makes kind of a cute display, like
a modem with TXD RXD lights.

I think there's such a patch for AtariWriter Plus, but I run AtariWriter 80
under SDX on my 130XE, and I didn't have to patch anything.

There is the Atari Classics patch for AW80 that Jeff McWilliams did, which
allows you to return to SDX from AW80. This would be useful for running
off of a hard drive (so you wouldn't have to reboot when you're done with
AW80), but you wouldn't need this patch simply to run AW80 under SDX or
from a hard drive.

I have also been unable to contact Mike recently, but I'd like anyone who plans to use the MAE assembler with the 65816 (or even 6502 users of MAE) to contact me. Mike was having a few problems with the assembler that I had trouble duplicating here, and contact with him was interrupted in the middle of creating another new version. So I'm not really sure how complete the .96 version is that he shipped out. At a minimum, the transfer memory command in the debugger will probably crash the system.

There have also been some great new improvements in memory usage and assembly speed. Basically, assembly speed has doubled. Memory will unfortunately be a little tighter in a 64K system, but unlike previous announcements, it will continue to run in this environment. As long as you have 128K+ of RAM however, free memory in this version has really been improved. You will have double the amount of symbol table storage. Source text can go all the way from LOMEM to $B7FF. Only 1K of main memory is currently being used by the assembler, from $B800-$BBFF. In addition, main memory from $4000-$7FFF is now always free to the user. Source text that resides in this memory area has been moved to another bank of extended RAM, so that this region of main memory is free to assemble object code into, or whatever.

There have been a lot of structural changes to provide all of this, and although I have been testing it for awhile with very few problems, it should still be considered in beta-test status. I would very much appreciate if any interested parties would contact me, to receive a new version by UU encoded EMail, and play around with it a bit.

Thanks,
John Harris - jharris@cup.portal.com

Conrad, before you jump on what Rick is saying here, (since it doesn't _exactly_ match what he originally said), consider that your statements weren't exactly accurate either. This is really nit-picky stuff, but I consider Rick's original statement to be closer than yours. Granted IRQVEC doesn't point directly to the page 2 vector, but it does point to a routine that jumps through the page 2 vector. Your description doesn't even acknowledge this first step. Let's just let this one pass, since the correct information has now been presented.

>>>and a few other said, the 6502 series has a hardware glitch which allows

Why not just write a routine that moves blocks of data between one area of memory and screen memory? The tricky part would be to keep track of priorities of the various images on the screen at one time.

: machines.]
: They are both great machines.

Actually, the guy that designed the Atari 8-bit computers is the one who designed the Commodore Amiga. His name was Jay Miner, and he also designed the Atari 2600. He did NOT design the Commodore VIC-20 or Commodore 64.

>And speaking of Jumpman, it only works in "Every" mode. But this slows it
>down to less than half of the original's speed.

Yes, Jumpman is very unstable on my 6100/66. However, Jumpman Junior
seems to work *much* better...and is basically the same game.

>Well here's something I'm sure you can help us out with. A lot of the
>8-bit software on servers is in .dcm format. And as far as I've found,
>there's no *Mac* program to convert these files to .atr files

That was a possible problem I thought of when I first got Rainbow. But
then it was pointed out to me that I was missing the maybe-not-so-obvious:
You can download DiskComm and run it under Rainbow to un-DCM files!
Very cool.

BTW, as long as I'm on the subject, I'm just wondering what sort of
success rate other Rainbow users have been having - what software doesn't
work for you? And what kind of Mac are you running it on? I spent a rainy
day yesterday copying over a bunch of files to my Mac and was quite happy
with the success rate. I'd say roughly 25 out of 30 files worked fine.
Including one that I *never* would have expected to work - Alternate
Reality, The City. Very nice seeing AR on my Mac. The sound (music) is
kinda choppy, but the game is fairly playable (the main bug being that
sometimes if you enter a building, the game keeps asking you to insert
Disk 2, Side x, and refuses to believe that the correct disk is inserted
in the drive...which means you're screwed). Didn't get around to
transferring The Dungeon yet...anybody know if it works under Rainbow?
(oh yes, the games that didn't work for me? Satan's Hollow crashed the
machine. Jumpman is very unstable. Fidget results in endless death.
Berzerk seems screwed up (*LONG* pauses of dead time) as does Mirax Force
(common problem? didn't they both have digitized speech in them?).
Overall, I've found Rainbow to be pretty impressive though. If the
sound could somehow be synched properly, it'd be just about perfect.

From: khaley@nova.gmi.edu
Message-ID: <khaley.811513962@gmi.edu>
Source record: 88493

I'm looking for some help with Phantasie. I'm trying to get the
Wand of Nickademus that the Dark Lord has, since it is the required
item to get into the Temple of the Dosnebian Clerics.

The Dark Lord is in the castle of the Black Knights, when you approach him,
you have three choices; attack, wait, or bribe. I've tried all three, and
each time, he just waves his wand and disappears.

Since the wand is necessary to complete the game, I'm now stuck.
Anyone have any idea how I get the wand?

Thanks for any information you may be able to offer.

/Kevin

Haven't made my cable yet, but have found everything I've downloaded seems to do 'ok' though I noticed the same problems with both jumpman and jumpman jr. though jumpman jr. worked eventually under every, it was slow.......

Chris actually suggested the diskcomm thing to me, I hadn't thought of that either. :) I have had no major problems except remembering which keys do what (i.e. shift and which is option?) I am thinking of making a keyboard template :)

XL mode hasn't really gotten me much but it's pretty neat to be able to switch in and see basic pop up.

I would be willing to run a site here on my machine that contains that
info and holds new stuff too.... How much traffic did you get, James? I
have 100 Megs available easily, and a direct connection, and I've already
got FTPd 3.0.0 running on this machine.

I think I could make it anonymous easily enough.
Is there a way I could get that stuff now? What kind of CD is it?

well, now if that setup doesn't sound damned familiar. I'd had the 1200XL
and 1010 for a couple of years, and about the time I was 14 or 15 or so I
was finally able to afford a 1050. Now, at the time I bought it, I was
living in a log cabin in Willow, AK, generally considered to be "the
sticks", but stopping short of "the bush". After several frustrating bouts
of "BOOT ERROR", I finally figured out that the disks and drive all had to
warm up to proper room temperature before being particularly useable (since
the house could easily get to freezing during the day, as no one was about
to tend the fire.)

2827. questions concerning rainbow, disk images, etc.

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-19 00:00:00 UTC
From: lcg@cs.duke.edu
Message-ID: <lcg-1909951304390001@abyss.cs.duke.edu>
Source record: 88498

Ok... I'm beginning to get into this more, but now I have some questions..

So I want to use DCM images in Rainbow, but it will not load them directly. Fortunately, both Chris and a previous poster mention that I need only run DiskComm on the Atari side of things (well, under Rainbow, in my case) and decompress the images that way.

1. Where does one find DiskComm? I looked in the Atari Merit archives under the 'disk' and 'utilities' directory, no luck, so far as I can tell.
2. Once I've got Diskcomm, I assume it loads the images or something. How can I tell it where to look for the file in Rainbow/Diskcomm? Isn't the image going to be too big to fit on one floppy, since it IS a floppy? I would import the file in, but I don't see where it's going to go. And if it decompresses/writes 'out' the image, where does it write too? I don't get it....

I heard someone say there was a DCM to ATR utility for Unix. Can someone point me to source or compiled binaries, please? I am beginning to think that would be the easiest solution.

Thanks for any help, anyone.

THanks to Chris for the Rainbow emulator, and the guy (sorry, I forget your name) whose been helping me out with some images of software (dos type stuff) that I needed.

Date: 1995-09-19 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.811514277@gmi.edu>
Source record: 88499

I also need help with Eternal Dagger (yeah, I've been playing both games on and off for quite a while now).

On the first island, you have to kill the Necromancer to end its curse and restore things back to normal. I have the Holy Morningstar and I have entered the Necromancer's dungeon and found him. I have killed him (via Quick Combat), but nothing outside has changed! The town of Greenbay is still deserted, so there's nothing else I can do.

Is there anything else I need to do to complete this part of the quest? I'm obviously missing something.

Any help or tips you can offer would be greatly appreciated.

/Kevin

Yes, this is true. You need a "blank" disk image; more specifically, simply
a spare disk. How to get a spare disk? Click a disk (ATR) file. Select
"Duplicate File" on the Finder. Viola, spare disk. (Rename it of course).

>1. Where does one find DiskComm? I looked in the Atari Merit archives
>under the 'disk' and 'utilities' directory, no luck, so far as I can tell.

Under "Archivers" at UMich: dskcom32.arc

>2. Once I've got Diskcomm, I assume it loads the images or something.

It opens the disk image file, reads in a chunk, and writes it out to the
destination disk. In your case, this spare disk you made.

>How can I tell it where to look for the file in Rainbow/Diskcomm? Isn't
>the image going to be too big to fit on one floppy, since it IS a floppy?

Nope - DCM files are usually 60K or less for a SD disk, and 120K or less
for an ED (enhanced, 127K disk) They can also be split into multiple parts
so that you can split one disk image onto multiple disks if you need to.

>I would import the file in, but I don't see where it's going to go. And
>if it decompresses/writes 'out' the image, where does it write too? I
>don't get it....

I believe Rainbow "installs" files by copying them into D1:, if there's
space. (Chris, could you also add an option to do the more SIO2PC/PC Xformer
-ish "make a disk out of the file" as well? It's easy enough to [C]opy from
the file-disk onto a real (image) disk. Also, many times (ARCs, DCMs, GIFs,
etc.) you don't WANT to keep the original file within a disk image!)

>
>I heard someone say there was a DCM to ATR utility for Unix. Can someone

B > Antic's
B > drawing?
B >
B > Also interested in:
B > Line drawing algorhythms(sp?)
B > Ray casting techniques.
B > What techniques did WayOut use.

1) Page flipping is neccessary for giving the illusion of two things
happening at once, or jumping to one screen while another is updated in some
way.

2) If you're wanting an interupt driven page flip, then you need to ask how
you want it to happen. A DLI should be possible, and may be a good way to
flip. You might even be able to page flip a split screen using
a DLI. The VBI is just as useful, I can't think of any reason not to use it.
You'll simply have to decide whether to install your routine as a stage one
or stage two VBI.

A couple of books you should consult are...

"Tricks of The Game Programming Gurus"; LaMothe, Ratcliff, Seminatore &
Tyler; SAMS Publishing;ISBN 0-672-30507-0

"Tricks of The Game Programming Gurus" is mostly written for a PC, but it
explains how to do things like line drawing algorythms, and raycasting,
among many topics. Code examples written in C are also provided. The book
is very well written. The explanations are well illustrated.

Also look for "Computer Animation Primer"; David Fox and Mitchell Waite
(The Waite Group);Byte/Mc Graw-Hill Ryerson; ISBN 0-07-021742-4

"Computer Animation Primer" has tons of info on computer graphics and
animation, but the best part is that all the example programs are written for
the Atari 8-bit. One section details very explicitly how to set up a
Vertical Blank Interupt (One of the best illustrated examples I've
ever seen).

>-Jim
>watkins@netaxs.com
>

Could be other things other than the mechanism but their is a simple test for MPI mechs. The MPI had the spring loaded doors vs the Tandons and the flip open door.

If its an MPI they had lots of problems with scuffed heads and or pad pressure problems. GENTLY add some weight to the top of the pressure pad (the piece that presses down on the disk and holds it against the head below, it had a little felt pad on it) when the read fail happens and see if it just starts reading. If it does you need to remove the 2 screws holding the assy on and gently bend the spring steel down for more tension, or replace the felt pressure pad.

If it's a Tandon flip door mech more than likely it's out of alignment. You need a scope and alignment disk to really handle that chore......

Good luck! Jerry

>

I guess that same can be said about the Atari 8-bits. Jay Miner was in charge of its design, but by no means did he design the whole thing. According to Doug Neubauer (the Pokey guy), here is the rundown according to Doug...

<quote>

The A800 VLSI hardware guys include:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators (from the grass valley group)
Joe Decuir - Antic and system and creator
A french guy (whose name I forget) - Antic logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - Pokey logic design
Mark Shieu - Pokey chip design
Steve Stone - Pokey layout design
Steve Smith - Technician for antic and gtia
Delwin Pearson - Technician for Pokey

There were a number of other people whoses names I have forgotten.
I have lost touch with most of them.

<end quote>

You just are mixing up two completely different things: a jump through a
vector and the vector itself.

Congratulations

2839. Atari 8-bit games?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-20 00:00:00 UTC
From: sibeling@u.washington.edu
Message-ID: <sibeling-2009950327210001@cs105-8.u.washington.edu>
Source record: 88361

I was curious as to the legality of copying old Atari 8-bit games... I know that several public FTP sites contain Commodore 64 games that were commercial back in their days, and I suppose they have gone past some sort of "statute of limitations" or something. But what about Atari 8-bit games? Is it legal to copy these or are they still under copyright? Hrmmm, thanks!

-Matt

>
>A Centofanti

I have seen this problem myself, thanks to some guy who informed me about it.

I take it that you seen the 'Please allocate more memory to Rainbow' alert box... am I right? If you do, this is a problem due to the allocation of sound channels. Even though the demo has no sound, it inits the channels anyway. It seems on some setups, the allocation of more than 4 channels is a no-no. But don't ask me why; I don't know!

But this is certainly the exception rather than the rule.

Chris.

2842. Re: questions concerning rainbow, disk images,

lcg@cs.duke.edu (Lyman C. Green, Jr.) wrote:

;1. Where does one find DiskComm? I looked in the Atari Merit archives
;under the 'disk' and 'utilities' directory, no luck, so far as I can tell.

I found it at xmission but I now believe that that site has finally been
scrapped. It says 'Public Domain' when you load it so I may make it available
on my web page.

;2. Once I've got Diskcomm, I assume it loads the images or something.
;How can I tell it where to look for the file in Rainbow/Diskcomm? Isn't
;the image going to be too big to fit on one floppy, since it IS a floppy?
;I would import the file in, but I don't see where it's going to go. And
;if it decompresses/writes 'out' the image, where does it write too? I
;don't get it....

a) load up discomm3
b) select the option to use 2 disk drives
c) format drive 1 (or load in a blank formatted image)
d) import the DCM file into drive 1
e) select option to 'unpack' the DCM file. DISCOMM3 looks for the file in
drive 1 and 'unpacks' onto drive 2.
f) when it's all over, save the image in drive 2.
g) insert the new image into drive 1 and reboot.

This is kinda off the top of my head; I will sort out a web page for this
procedure in the next few days!

;I heard someone say there was a DCM to ATR utility for Unix. Can someone
;point me to source or compiled binaries, please? I am beginning to think
;that would be the easiest solution.

Yes, it would be. Someone sent me such a util but I was unable to uncompress
the .sit file.

Good luck,

Chris Lam.

You don't need ATR or XFD images; simply convert existing DCM disk images into ATRs.

If you need new, blank disk images, use SIO2PC or download a blank one from UMich.

The only place that seemed to support ATR/XFD for downloading (other than blanks, of course) was James King's (now gone) FTP site.

Not to defend an otherwise oulandish price list by Terry, but the ATR8000 was reasonable. There are some restrictions I've run into with mine. If someone buys it, it has to use its own handlers for the RS232 port & I think the fastest I've been able to get mine to run is with a 2400 baud modem. The CP/M, MS DOS, or whatever disk drive mechanisms you decide to stick in it all use 300RPM <Unless you find an 8" drive> and I belive the timing hole on the disk. This has meant problems for me since not all disks I've created on a 1050 an some game software will not run properly. The ATR also doesn't understand high speed mode with Sparta DOS. Given the choice between expanding an existing system with say 3 1050s and an 850 or picking up the ATR, I'd go with the ATR.

2850. FS/T: Classic computer games and systems [09/21/95]

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-21 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <43r4j6$oq4@ixnews4.ix.netcom.com>
Source record: 88372
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.ti

updated 09/21/95

I have the following Classic computer equipment for sale or trade.
The list includes software and hardware from Atari, Commodore,
and Texas Instruments.

Everything is sold as is. Unless specified, all items have been
tested and are in perfect working order.

Buyer has ten (10) days to send payment, and pays all shipping
costs, which will be sent via U.S. Snail. The shipping cost
depends on both the weight of the package and the distance that it
is traveling. Buyer has the choice of either first class or parcel
post (slower, but cheaper).

Payment must be made in U.S. funds, by either check or money order,
drawn from a U.S. bank branch. Canadian buyers must send a Canadian
Postal Money Order, payable in U.S. funds. This is the only way I
have found to deal with my friends to the north (my bank is very
picky, but the U.S. Post Office will cash a Canadian Postal M.O.)

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 7.50 ATARIWRITER
$ 7.50 BASIC
$ 6.00 GALAXIAN
$ 9.00 LETTER-GO-ROUND (Sesame Street) [CBS Software]
$ 6.00 MISSILE COMMAND
$ 5.00 PAC-MAN
$ 5.00 STAR RAIDERS

*****

COMMODORE 64 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 9.00 FAST LOAD (Epyx)
$ 7.50 FROGGER (Parker Brothers)
$ 5.00 JUPITER LANDER
$ 5.00 KICKMAN
$ 5.00 MAGIC DESK I
$ 5.00 MUSIC COMPOSER
$ 6.00 OMEGA RACE
$ 5.00 SPEED/BINGO MATH

Complete cartridges. With box, and manual:
$ 7.00 KICKMAN

*****

COMMODORE VIC-20 COMPUTER:

Loose cartridges, no box, manual, or overlays:
$ 5.00 ADVENTURE LAND (#1914)
$ 5.00 ALIEN (#1906)
$ 5.00 AVENGER (#1901)
$ 5.00 GORF (#1923)
$ 5.00 OMEGA RACE (#1924)
$ 7.50 Q*BERT (Parker Brothers)
$ 4.00 RADAR RAT RACE (#1910) -- no label
$ 4.00 SPEED MATH / BINGO MATH (#1933)
$ 5.00 THE COUNT (#1917)

Loose cartridges with manual. No box:
$ 5.00 COSMIC CRUNCHER (#1922)

*****

TEXAS INSTRUMENTS (TI 99/4A) COMPUTER:

Loose cartridges, no box or manual:
$ 4.00 ADVENTURE
$ 4.00 BEGINNING GRAMMAR
$ 4.00 BLASTO
$ 4.00 CAR WARS
$ 4.00 CHISHOLM TRAIL
$ 4.00 HOME FINANCIAL DECISIONS
$ 4.00 HOUSEHOLD BUDGET MANAGEMENT
$ 4.00 HUNT THE WUMPUS
$ 7.50 JAWBREAKER II (Sierra On-Line)
$ 4.00 MUNCH MAN
$ 4.00 PARSEC
$ 7.50 PROTECTOR (Atari)
$ 4.00 TI INVADERS

****

HARDWARE:

NOTE #1 FOR THOSE BUYING SYSTEMS: If you buy certain systems (they are marked) you will have the option of buying a BRAND NEW RF switchbox for $5 that is virtually identical to one sold at Radio Shack for $7, plus tax. It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully.

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 600XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second ATARI 600XL (haven't checked it out yet, so I don't know if it works or not), FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #2

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800XL COMPUTER with original power supply, and RCA cable.

I will also throw in a second non-working ATARI 800XL for parts, FREE.

This is a complete system, except for RF switchbox.

$49.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 65XE COMPUTER with original power supply, and RCA cable

This is a complete system, except for RF switchbox.

$39.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 130XE COMPUTER with original power supply, and RCA cable.

This is a complete system, except for RF switchbox.

$64.00

*****

LOT #5

ATARI 1050 (127K) DISK DRIVE, with original power supply, and
one (1) Molex connector cable.

$39.00

*****

LOT #6

ATARI 1050 (127K) DISK DRIVE, with one (1) Molex connector cable.

This disk drive doesn't include the power supply.

$34.00

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER with box, User's Guide (175 pgs.), power
supply, and RCA cable.

I will also throw in a second non-working COMMODORE 64 for parts,
FREE.

This is a complete system, except for RF switchbox.

$29.00

*****

LOT #8

COMMODORE 1541 DISK DRIVE with power cord, and serial cable.

$25.00

*****

LOT #9

COMMODORE 1541 DISK DRIVE.

Power cord and serial cable are available from Radio Shack for
around $11.

$20.00

*****

LOT #10

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER with TI power supply and RF switchbox, and one function key strip (for keyboard).

I will also throw in a second working TI 99/4A console, FREE.

This is a complete system. Nothing else is needed to use.

$24.00

*****

I am interested in accepting 8-bit computer and/or pre-Nintendo video game systems and/or cartridges in trade towards any of these items. Systems I am interested in include, but are not limited to, the following list:

ATARI 2600 (still need Starpath Supercharger [Arcadia])
ATARI 5200
ATARI 7800
ATARI 8-BIT COMPUTERS (still need Atari color monitor)
BALLY ASTROCADE
COLECOVISION
COLECO ADAM COMPUTER
COMMODORE 64 COMPUTER
COMMODORE VIC-20 COMPUTER
FAIRCHILD CHANNEL F
INTELLIVISION
MICROVISION (still need system)
ODYSSEY2
RCA STUDIO II (still need custom RF switchbox and power supply)
SEGA MASTER SYSTEM
TEXAS INSTRUMENTS T.I. 99/4A COMPUTER (still need TI color monitor)
TOMY TUTOR
TRS-80 COLOR COMPUTER
VECTREX

*NOTE: I already have most of these systems. What I am mainly looking for now is software (primarily cartridge based).

Please send a list of what you have, and please be specific (indicate whether or not cartridges and/or systems include the box and/or instruction manual). Please mention any controllers that are included. Please also mention what you are looking to get for your equipment.

Request system reservations at: VGA2000@ix.netcom.com
or dw901@cleveland.freenet.edu

>Conrad, before you jump on what Rick is saying here, (since it doesn't
>_exactly_ match what he originally said), consider that your statements
>weren't exactly accurate either. This is really nit-picky stuff, but I
>consider Rick's original statement to be closer than yours. Granted
>IRQVEC doesn't point directly to the page 2 vector, but it does point
>to a routine that jumps through the page 2 vector. (...)

Unfortunately, I have "jumped" yet yesterday, although it may not reach
everyone in this group (postings from Poland usually appear in 2-3
days after they have been sent).

Yes, the IRQVEC don't point to the SINRDYI directly (and I forgot it, you
are right), but I generally meant, that it points to the CODE, not to a
VECTOR TABLE (as Rick said). If it wouldn't point to the code, the computer
would crash every time an IRQ appears.

>>So perhaps am wrong. But docs, that are reachable in Poland don't have
>>this information. Also I never noticed, that the BRK failed. But perhaps am
>>wrong, any further info will be welcome.

>Did you catch the post I made about this a couple of days ago? If you're
>curious, I can EMail or repost the routine that demonstrates the problem.

If something like this appeared, I seemed to drop it (our newsreader isn't
very comfortable and I try to use it as rarely as possible). If it isn't
a problem, please email me the info.

>My example isn't pointless, I didn't make any errors nor "typos"...

Yes, example isn't pointless, because it isn't a 'theoretical' piece of
code from an 'Assembly Language guide' (or something), but it is from
a real, working, useful (for me) program. Even if the time/memory savings
are relatively small, you at least can write it more quickly and the
source code is shorter :) .

>I got one (by showing up in the Phoenix area). I can't get it to read
>or otherwise recognize MyDOS disks, but otherwise it seems to work.

Of the two 4.22 chips I received, one will not CD to sub-directories but otherwise seems to work fine and one that runs like a champ! As far as I can tell, it has no problem reading MyDOS disks (4.5) and MyDOS sub-directories.

Sometime later this week I hope to get around to playing with the new SIO2.SYS and MUX and see how everything works.

Mike

2853. Q: What would cause loss of inverse characters on 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-21 00:00:00 UTC
From: mbouthil@aol.com
Message-ID: <43rnjb$92g@newsbf02.news.aol.com>
Source record: 88375

I probably don't want to know the answer to this but here goes:

I just noticed that there are no inverse characters on my Atari 800XL. This includes the cursor in BASIC (which is now invisible). Turning the computer off for a few minutes and then turning it on does not help.

Anyone heard of this happening? Does this sound like my ROM is damaged or are the characters stored on a separate (socketed?) chip.

I don't recall this happening last week when my friend gave me this unit so I think it is a new problem. When inverse mode is used, letters do show up but they are just not inverted. I don't think it is a defective inverse button because that wouldn't explain the loss of my cursor.

Any suggestions? Everything still seems to work, this is just annoying.

Hi all,

You can find an image of Disk Communicator 3 and instructions how to unpack DCM files at the usual web site, namely

http://www.aston.ac.uk/~lamcw/emulators.html

and you will need the full shareware Rainbow to use it.

Regards,

Chris Lam.

This has all been covered before. Please, please, please, don't get it
started again. I know of no staute of limitations on copyrights. As
long as the original publisher kept the copyright, it's still
copyrighted. I'd say most of the stuff on those C64 sites is illegal
as hell and it would be illegal to start an ftp site with tons of 8bit
commercial software on it.

Sincerely,
- Byron Followell

Does anyone have any experience using Diskcomm 3 to get either DOS 2.5 or MYDOS(I think 4.5) files from a .DCM file? (Especially using an Atari 1050 disk drive & DOS 2.0) Any help would be appreciated.

That is weird.

The only thing I can think of is to check the value of location 755:
PRINT PEEK(755)

Here's a partial list of possible values.
CHACT 755 02F3 Character mode register, controls how
characters are displayed:
VALUE INVERSE CHARS ORIENTATION CURSOR
0 inverse upright absent
1 blank upright absent
2 normal upright transparent
3 solid upright opaque
(see http://er4www.eng.ohio-state.edu/~funkr/Atari/Ref/peekpoke.txt
for more.)

Also try
PRINT CHR$(65+128)
You should get an inverse A.

>Anyone heard of this happening? Does this sound like my ROM is damaged or
>are the characters stored on a separate (socketed?) chip.

I believe the character set is stored in the ROM. It does sound to me
like a bad ROM.

Haven't used an Atari for years, but it was a fun machine when I had it. My cousin has an old 800 that his son, age 5, is now using. He has many carts to use but no docs.

Is there a FAQ, FTP or WWW site that might have docs?? Otherwise, anyone want to sell some old docs??

2860. Atari 400: What now?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-21 00:00:00 UTC
From: pmunn@westnet.com
Message-ID: <43qo8t$fnm@mycroft.westnet.com>
Source record: 88382

Hello Atari fans!

I got this stuff at a garage sale:

======
An Atari 400 with:

Cartridges:
BASIC (Zzzzz)
Asteroids (Yeah!)
Computer Chess (Zzzzz)
3d Tic Tac Toe (Zzzzz)

Model 410 Program Recorder (cassette drive)
(no tapes, and attempting at recording didn't work)

Atari 835 Direct Connect Modem and Power Adaptor
======

The tape drive appears to be useless.

When I turn on the modem, the connect light clicks on for a split second and
the power light stays on. This seems to be normal for modems.

I want to:
1) Find more cartridge games.
2) Find the cartridge that can use the modem!

Anyone have any ideas?

It sounds to me like one of your hardware registers has gone. If it was the
rom, you wouldn't get normal characters. The character set is not stored
inverted in rom, that is done in hardware depending on certain registers.
It is very possibly a loose chip in it's socket, so try reseating them.
I would guess the Antic chip would be the one responsible for inverting
characters.

2867. ATARI equipment MUST SELL!!

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-21 00:00:00 UTC
From: Terry Ortman <102603.2652@CompuServe.COM>
Message-ID: <43sf85lbr3@mhafm.production.compuserve.com>
Source record: 88389
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.discussion

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $100.00 or best offer.

ATR8000 64K CP/M computer, for use with Atari 8-bit computers or Dumb (IBM computer) terminals. Runs all CP/M 2.2 software, supports up to 4 disk drives, any size, any density, 8 inch, High Denisty 5.25 and 3.5 floppies, any IBM compatible printer, modem port for using any RS232C compatible external modem, includes Auto-Term Disk for Atari computers, CP/M 2.2 Master Diskette, several CP/M disks, ATR8000 Manual, MY-DOS master Disk, CP/M Supplement Manual, modem cable, printer cable, original cost $695.00 for the ATR8000 Basic system, printer cable $39.95, Modem cable $39.95, asking $125.00.

Dual Floppy Disk Drives in case with power supply and cooling fan, connecting cable, for above ATR8000 or any IBM compatible computer. Case can hold 4 half height 5.25 floppies, original cost $895.00, Case alone is worth $89.95 at most supply companies, asking $85.00.

BOTH ATR8000 & Dual Floppies in case, $150.00.

ATR8000, as above, only with Co-Power 88 installed. I bought this from a guy for $375.00, does NOT have the Co-Power 88 Boot Disk, needs a copy. The guy who said he was going to send me a copy never did. Need to recover my loss on this unit.....$350.00

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes manual, power supply, original cost $179.95, asking $75.00.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $175.00 for the entire package.

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Send all inquiries/offers to: admiral@freebbs.com via Internet E-Mail,
or E-Mail reply to this, all serious offers will be considered! Will
also consider trading for IBM computer (80386SX at least).

The copyrights on old Atari and Commodore software won't start expiring for
several decades yet. Since very few old commercial titles have been
re-released as shareware/freeware/PD, it's just as illegal to distribute
copies of them now as it ever was.

I don't know about the status of Commodore FTP sites, but believe it or not
the 8-bit Atari Internet community remains free of FTP sites with pirated
commercial software on them. Some of us even continue to buy the old
commercial games from commercial Atari vendors.

Sorta like Edison "consulted" on the light bulb, eh?! Unless you
have some information that a lot of us don't, I think you're grossly
understating Jay Miner's contribution to the Amiga. He saw it as the
follow-on to the Atari 800.

a >Is anybody able to tell me what the video signals
a >on the Atari Monitor connector exactly are (there
a >are three of them) :
a > -) composite luminance (used for monochrome monitor)
a > -) composite video (used for color monitor)
a > -) composite chroma (?)

Howdy Mario. If you look at the back of you computer, the monitor plug pins
are numbered 1, 4, 2, 5 and 3, starting at the top right and going clockwise.

1 = Comp. Lum.
2 = Ground
3 = Audio Out
4 = Comp. Video
5 = Comp. Chroma

If I remember correctly, some 800XL's miss one of the Comp. signals. ANALOG
Computing (a magazine that died a couple a years ago) once spread the rumor,
that ATARI once had plans to use this pin for Audio too (to get STEREO sound).

The XEGS does NOT have this monitor plug.

a >I'm also interested in the former connector standards
a >(I only know a european standard I think which was called
a >FBAS for a color monitor with two cinch plugs. One for
a >video the other for audio).

FBAS and comp. video or CVBS are all te same. The XEGS uses this system too.
One cinch for Comp. Video, one for sound. BTW I think in the USA they call
thse "Cinch busses" "RCA busses". (I live in the Netherlands.)

a >I saw that the Amiga Monitor 1083 or so uses FBAS too.
a >Does this mean that I can use this monitor with my ATARI?
a >Can I connect every FBAS monitor to my ATARI or do I have
a >to take into account special specifications (frequencies,
a >resolutions,...).

Yes you can. Or the 1084 or 17.. (?) series, not sure about the 19.. (?)
series. In reality, those "Amiga" monitors are built by Philips. I'm using
a CM8833, it's a Stereo monitor and I think it's the same as the 1084.
```

a >I also saw an very old announcment of an philips monitor
a >which could be connected to the Amiga or to the Atari ST.
a >Does that also mean that I can connect a Atari ST monitor

a >
a >Thanx for your time to read this,
a >mario

AFAIK you can NOT use "ST" monitors on the classic Atari's.

Maybe they have a SCART/Euro-AV bus (the big 21 pin bus). My CM8833 has one.
It came with the schematics for this monitor. Pin 20 is FBAS or Comp.Video
and pins 2 and 6 are Audio In.

Howdy Ben

Why not use a cache or something. The head would read one 512 byte sector,
this sector would be stored in the cache. Some hardware would read the
cache and and turn it into two eight bit sectors. This way, you read 512
bytes at once and let the electronics do the "split up" (read: fool the
computer)

I think Mapping... mentiones somewhere that the classic Atari can use sectors
up till 65536 bytes long. Don't know where. I do remember though, that it
uses TWO bytes for the sector size.

The only time you get 512 bytes per sector with the classic Atari is when you
use the BlackBox (I have heard that the MIO 2 will do 512 byte sectors too,
but it's been a long time since Mike Hohman was seen in public). The BlackBox
(and supposedly (sp?) the MIO 2) breaks up the 512 byte sector in two 256 byte
sectors, without telling DOS.

A yes, the above only goes for hard drives. Floppy drives connected to the
BlackBox use 36 sectors per track in High Density.

720 kByte = 2 sides with 80 tracks with 18 sectors of 256 bytes each.
1.44 meg = 2 " " 80 " " 36 " " " " " .

2876. ATARI software for sale?

Newsgroup: comp.sys.atari.8bit
Date: 1995-09-22 00:00:00 UTC
From: s001919x@ypserv.rz.fhtw-berlin.de
Message-ID: <43v3h5$kk5@mars.fb1.fhtw-berlin.de>

Hi folks!

As a new member of the Internet community, I try to find a distribution site for
old atari-8-bit games. Especially I'am searching for the whole "Alternate Reality"
story for about 6 years without getting any clue, where to get ist.
Does anybody know a site where you can order old atari games and pay per visa?
I would greatly appreciate any advice.

Please mail to: s001919x@ypserv.rz.fhtw-berlin.de

Regards, Rene

: be set to the appropriate value. The reason this is a problem is
: that, as all good scrolling programmers know, you need LMS
: instructions on each scrolling line which forbids the use of a
: DLI. Hence the only solution I can see is to insert a blank scan

You could monitor VCOUNT in a tight loop and store values into the
HSCROL register *without* using a DLI. This of course will use all
the available cpu time available during the screen refresh, leaving
you with the vertical blank period to do any other processing.

If you needed more cpu time and are only scrolling a small region
of the screen you could generate a hybrid solution:- A DLI could
be generated *prior* to the horizontal scrolled region. The DLI
routine then monitors VCOUNT as before and finally executes the
RTI after the last change to HSCROL. This would free the cpu for
normal processing except during the critical screen region.

For example:

```
dli:
save registers

ldy #0
loop:
lda hscrol_values,y ; get next value to stuff into hscrol
ldx vcount_values,y ; get value of vcount for next change
wait: cpx vcount ; wait for beam to reach a specific line
bne wait
sta wsync
sta hscrol
iny
cpy #number_of_parallex_scroll_levels ; last change?
bne loop

restore registers

rti
```

The first scanline (The first line of the usual blank eight lines
instruction) occurs when vcount is four. vcount is incremented every
other scanline: i.e. two scanlines will have the same value for
vcount, the first scanline can be used straight away and the second

can be accessed after storing to wsync.

Needless to say this is very timing critical.

Hope this helps

Actually, there was a game for the 8-bit that had parallax scrolling. It was on an old XE Group DOM or a Page 6 issue from a couple of years ago, where you had to go around killing off viruses and diseases before they killed you. I can't remember the name of it right now, but I'll look through the club library and find it soon.

It's more like $200 for the drive and $15-$20 per cart, depending on quantity purchased (10+ carts at a time is $15 per cart).

> Can I use an internal???

No internal Zip drives are being sold yet, and it's not advisable to remove the Zip drive from the external case. Several users have reported to me that parts of the case act as functional structural necessities, and that by removing the case you disable parts of the drive (such as the eject mechanism).

> Has anybody tried this yet?

I've gotten it to work under SpartaDOS with a borrowed Black Box.

> How available is it?

Average one month wait.

> How reliable is it?

Quite. I can personally attest to several hundred well-abused hours.

What do you mean here? I use DLIs on LMS lines all the time.

I also second the suggestion made by someone else to use redefined characters as well. You could create some fairly simple objects like rocks or tree trunks and shift them through the playfield characters at a rate faster than the playfield is scrolling.
